## APPLICATION NOTES

### 1. CTRL Terminal

When open or high impedance, the converter works well; When this pin is 'high', the converter shuts down; It should be noted that the input current ( $I_C$ ) should be between 5-10mA, exceeding the maximum 20mA will cause permanent damage to the converter. The value of R can be derived as follows:

$$R = \frac{V_C - V_D - 1.0}{I_C}$$

### 2. Recommended Circuit

If you want to further decrease the input/output ripple, an "LC" filtering network may be connected to the input and output ends of the DC/DC converter, see (Figure 1).

Figure 1

However, the capacitance of the output filter capacitor must be proper. If the capacitance is too big, a startup problem might arise. For every channel of output, provided the safe and reliable operation is ensured, the greatest capacitance of its filter capacitor sees (Table 1).

Lin	--	4.7 ~ 120 $\mu$ H

Lout	--	2.2 ~ 10 $\mu$ H

### 3. Input

#### Current

While using an unstable power source, please ensure the output voltage and ripple voltage do not exceed indexes of the converter. The preceding power source must be able to provide for the converter sufficient starting current  $I_{py}$ .

General:  $I_p \leq 1.4 * I_{in-max}$

### 4. No parallel connection or plug and play
