# Operation

## ■ Functional Overview

### Receiving Commands

The IC receives commands with two-wire serial communication to control 9 LED lines. Commands are received in a 40-bits-per-command communication format.

### Gradation Control

The lighting of the 9 LED lines is controlled individually or by group with 16-level lighting gradation and 32-level lighting speed. The exponential control of output duty cycle allows lighting gradation that matches the human visual characteristics. In addition, the specification of lighting speed allows fade-in and fade-out with up to 1,024 levels.

### Number of Control Lines

The IC has two device address lines, each of which can be configured in seven ways by terminal configuration. This provides up to 49 patterns of device address configuration, allowing up to 441 lines to be controlled on the same communication line. Two device address lines can be combined to configure a device group.

## ■ Communication Specifications

Input signals to SDA-I and SCL-I are input via the filter circuit (0.1μs delay) to the communication circuit. An SDA-I signal that is input to the communication circuit is taken in as serial data at the rising edge of an SCL-I signal. When serial data is received in a different format from the communication format, the data will be invalid.

When the START signal, "11111111" is detected, the communication circuit takes in data as new serial data, whether it is on stand-by or in the middle of intake of serial data.

Input signals to SDA-I and SCL-I will be output via the asynchronous buffer to SDA-O and SCL-O without going through the filter circuit.

### Description of Communication Format

Device Selection Data	Device ID	Device-specific ID (Fixed to "00" for this IC)
	Device Address A	Specified with the ADRA0 to 2 terminals
	Device Address B	Specified with the ADRB0 to 2 terminals
Control Data	Control	Specifies control (data saving / immediate reflection)
	Output Address	Specifies the terminal to output (Individual specification and collective specification are possible)
Lighting Data	Lighting Speed	Specifies changing speed of free-running gradation control (32 levels)
	Lighting Gradation	Specifies the brightness of lighting (16 levels)

## ■ Control Command

### Device Selection Data (8 bits)

Device selection data dvc_dat (7:0)							
Device ID		Device Address A			Device Address B		
0	0	ADRA2	ADRA1	ADRA0	ADRB2	ADRB1	ADRB0

The device ID is fixed. The correspondence between the device addresses A and B and the setting terminals ADRA0 to 2 and ADRB0 to 2 is shown in the table. (Setting "L"...Data "0". Setting "H"...Data "1").

When ADRA0 to 2 = "111", the device address A line is specified collectively, and when ADRB0 to 2 = "111", the device address B line is specified collectively.

Because up to 7 addresses can be specified for each of device address A and device address B, their combination allows the specification of up to 49 addresses.

## Control Data (7 bits)

Control data ctrl_dat (6:0)						
Control	Output Address					
ctrl	o_adr(5)	o_adr(4)	o_adr(3)	o_adr(2)	o_adr(1)	o_adr(0)

The control signal, 'ctrl', activates the operational control shown in the following table.

- When ctrl = "0", latch operation is activated, in which data is only stored in latch registers and will not be reflected in the output.
- When ctrl = "1", load operation is activated, in which data is stored in the specified latch registers and the data of the latch registers in all addresses will be stored in the load registers.

**Note:** The change time per 1/15 of brightness represents the time required for a change from, for example, 10/15 to 11/15 of brightness.

The change time from 0/15 to 15/15 of brightness and vice versa represents the time required for a change from 0/15 of brightness (light OFF) to 15/15 of brightness (light completely ON). However, these times are median values and depend on the driving output PWM cycle.

## ■ Functional Terminals/Setting Terminals

<b>ADR terminals</b>	The ADRA terminal and ADRB terminal set device address A and device address B, respectively. For “H” setting, connect the terminal to V <sub>DD</sub> and for “L” setting, connect the terminal to GND
<b>INV terminal</b>	This terminal sets the polarity of OUT terminal. <ul style="list-style-type: none"> <li>• When the terminal is used with “L” as active (e.g., for directly driving an LED), connect the terminal to V<sub>DD</sub></li> <li>• When the terminal is used with the “H” as active (e.g., for driving an LED with a driving transistor), connect the terminal to GND.</li> </ul>
<b><math>\overline{\text{RST}}</math> terminal</b>	When the voltage of the $\overline{\text{RST}}$ terminal becomes “L”, the internal circuit will be reset and the output will be open.

## ■ Application Example

# Precautions for Use

## ■ Correct Use

- The absolute maximum rating is the limit value which should not be exceeded even in a flash. Exceeding this value can cause deterioration of the characteristics or complete failure of the IC.
- Check the operation at the communication frequency to be used before using the device.
- Sufficiently take into consideration the static electricity, chattering and voltage of the input to be connected when determining each input circuit.
- Although the device contains an ESD protection circuit, static electricity that exceeds the function may damage the device. When handling the device, exercise due caution by, for example, grounding the human body.
- Due to potential damage, do not use product that has been dropped or that has come into contact with water.

## ■ Recommended Reflow Conditions

### Allowable Temperature Profile Conditions

Product mounting method should be by Reflow and we recommend the following temperature profile. Reflow no more than two times, maximum.

### Storage Conditions before Mounting

Moisture absorption by the plastic package will increase the possibility of faults, such as cracks; therefore, take enough care for storage.

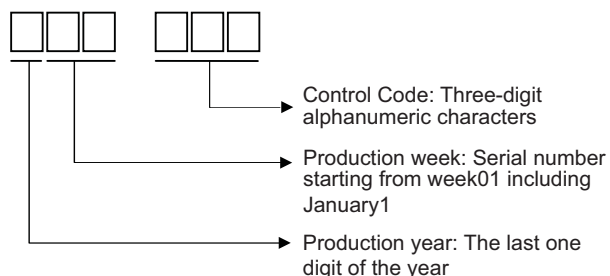

Storage Conditions	Period
5 to 30°C, 40 to 70%RH	One Year

## ■ RoHS Directive Compliance

Models that are indicated as being RoHS compliant are free of the following six substances.

Lead:	1,000 ppm max.
Mercury:	1,000 ppm max.
Cadmium:	100 ppm max.
Hexavalent chromium:	1,000 ppm max.
PBB:	1,000 ppm max.
PBDE:	1,000 ppm max.
