

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1. GENERAL DESCRIPTION

LPDDR2 is a high-speed SDRAM device internally configured as a 4-Bank memory. These devices contains 512Mb has 536,870,912 bits.

All LPDDR2 devices use a double data rate architecture on the Command/Address (CA) bus to reduce the number of input pins in the system. The 10-bit CA bus contains command, address, and Bank/Row Buffer information. Each command uses one clock cycle, during which command information is transferred on both the positive and negative edge of the clock.

For LPDDR2 devices, accesses begin with the registration of an Activate command, which is then followed by a Read or Write command. The address and BA bits registered coincident with the Activate command are used to select the row and the Bank to be accessed. The address bits registered coincident with the Read or Write command are used to select the Bank and the starting column location for the burst access.

2. FEATURES

- | | |
|---|---|
| <ul style="list-style-type: none"> • VDD1 = 1.7~1.95V • VDD2/VDDCA/VDDQ = 1.14V~1.30V • Data width: x16 / x32 • Clock rate: up to 533 MHz • Data rate: up to 1066 Mb/s/pin • Four-bit prefetch DDR architecture • Four internal banks • Programmable READ and WRITE latencies (RL/WL) • Programmable burst lengths: 4, 8, or 16 • Auto refresh: All bank refresh mode only • Partial Array Self-Refresh (PASR):
All bank or per bank, bank mask is supported but segment mask is not supported • Precharge command: All bank or per bank • Read with auto-precharge • Write with auto-precharge | <ul style="list-style-type: none"> • Deep Power Down Mode (DPD Mode) • Programmable output buffer driver strength • Data mask (DM) for write data • Clock Stop capability during idle periods • Double data rate for data output • Differential clock inputs • Bidirectional differential data strobe • Interface: HSUL_12 • JEDEC LPDDR2-S4B compliance • Support package:
Single channel: 134 VFBGA (10mm x11.5mm)
Single channel: 168 WFBGA (12mm x12mm) • Operating Temperature Range:
-25°C ≤ TCASE ≤ 85°C
-40°C ≤ TCASE ≤ 85°C |
|---|---|

5. PIN DESCRIPTION

5.1 Basic Functionality

Name	Type	Description
CK_t, CK_c	Input	Clock: CK_t and CK_c are differential clock inputs. All Double Data Rate (DDR) CA inputs are sampled on both positive and negative edge of CK_t. Single Data Rate (SDR) inputs, CS_n and CKE, are sampled at the positive Clock edge. Clock is defined as the differential pair, CK_t and CK_c. The positive Clock edge is defined by the crosspoint of a rising CK_t and a falling CK_c. The negative Clock edge is defined by the crosspoint of a falling CK_t and a rising CK_c.
CKE	Input	Clock Enable: CKE HIGH activates and CKE LOW deactivates internal clock signals and therefore device input buffers and output drivers. Power savings modes are entered and exited through CKE transitions. CKE is considered part of the command code. See 7.5.1 “ Command Truth Table ” for command code descriptions. CKE is sampled at the positive Clock edge.
CS_n	Input	Chip Select: CS_n is considered part of the command code. See 7.5.1 “ Command Truth Table ” for command code descriptions. CS_n is sampled at the positive Clock edge.
CA[n:0]	Input	DDR Command/Address Inputs: Uni-directional command/address bus inputs. CA is considered part of the command code. See 7.5.1 “ Command Truth Table ” for command code descriptions.
DQ[n:0]	I/O	Data Inputs/Output: Bi-directional data bus. n=15 for 16 bits DQ; n=31 for 32 bits DQ.
DQSn_t, DQSn_c	I/O	Data Strobe (Bi-directional, Differential): The data strobe is bi-directional (used for read and write data) and differential (DQS_t and DQS_c). It is output with read data and input with write data. DQS_t is edge-aligned to read data and centered with write data. For x16, DQS0_t and DQS0_c correspond to the data on DQ0-7; DQS1_t and DQS1_c to the data on DQ8-15. For x32 DQS0_t and DQS0_c correspond to the data on DQ0-7; DQS1_t and DQS1_c to the data on DQ8-15; DQS2_t and DQS2_c to the data on DQ16-23; DQS3_t and DQS3_c to the data on DQ24-31.
DMn	Input	Input Data Mask: DM is the input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS_t. Although DM is for input only, the DM loading shall match the DQ and DQS (or DQS_c). DM0 is the input data mask signal for the data on DQ0-7. For x16 and x32 devices, DM1 is the input data mask signal for the data on DQ8-15. For x32 devices, DM2 is the input data mask signal for the data on DQ16-23 and DM3 is the input data mask signal for the data on DQ24-31.
VDD1	Supply	Core Power Supply 1: Power supply for core.
VDD2	Supply	Core Power Supply 2: Power supply for core.
VDDCA	Supply	Input Receiver Power Supply: Power supply for CA[n:0], CKE, CS_n, CK_t, and CK_c input buffers.
VDDQ	Supply	I/O Power Supply: Power supply for Data input/output buffers.
VREF(CA)	Supply	Reference Voltage for CA Command and Control Input Receiver: Reference voltage for all CA[n:0], CKE, CS_n, CK_t, and CK_c input buffers.
VREF(DQ)	Supply	Reference Voltage for DQ Input Receiver: Reference voltage for all Data input buffers.
VSS	Supply	Ground
VSSCA	Supply	Ground for CA Input Receivers
VSSQ	Supply	I/O Ground
ZQ	I/O	Reference Pin for Output Drive Strength Calibration

Note: Data includes DQ and DM.

5.2 Addressing Table

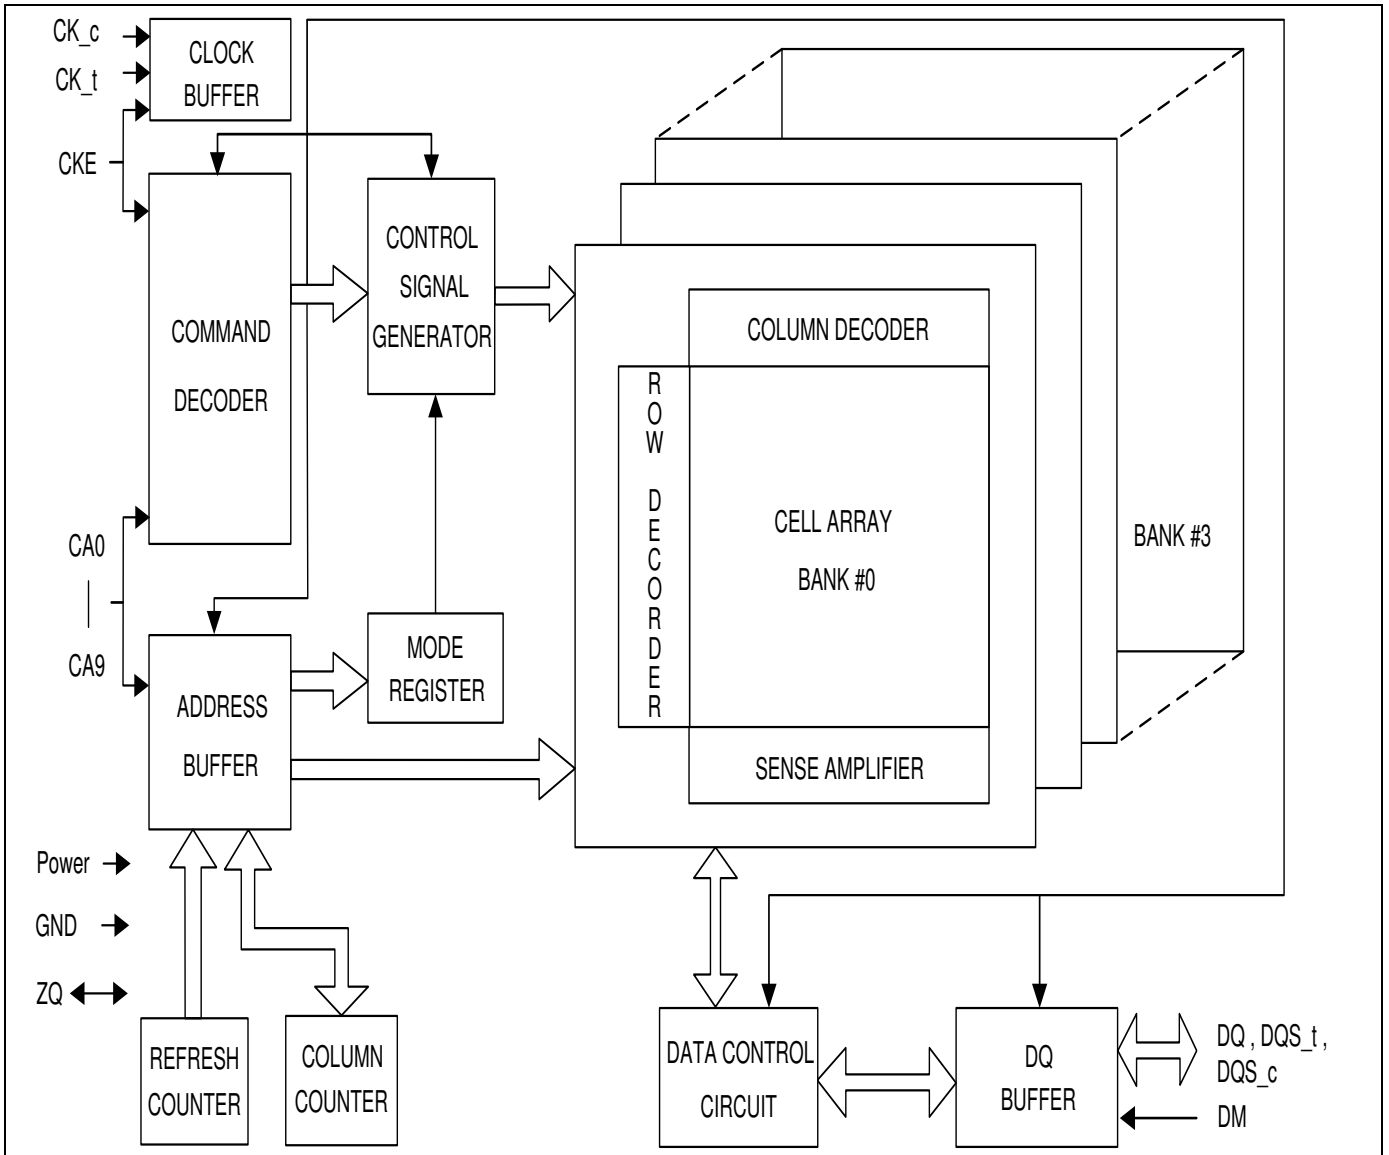

Density		512Mb
Number of Banks		4
Bank Addresses		BA0-BA1
x16	Row Addresses	R0-R12
	Column Addresses* ¹	C0-C9
x32	Row Addresses	R0-R12
	Column Addresses* ¹	C0-C8

Notes:

1. The least-significant column address C0 is not transmitted on the CA bus, and is implied to be zero.
2. Row and Column Address values on the CA bus that are not used are "don't care".

6. BLOCK DIAGRAM

7. FUNCTIONAL DESCRIPTION

LPDDR2-S4 devices use a double data rate architecture on the DQ pins to achieve high speed operation. The double data rate architecture is essentially a 4n prefetch architecture with an interface designed to transfer two data bits per DQ every clock cycle at the I/O pins. A single read or write access for the LPDDR2-S4 effectively consists of a single 4n-bit-wide, one-clock-cycle data transfer at the internal SDRAM core and four corresponding n-bit-wide, one-half-clock-cycle data transfers at the I/O pins.

Read and write accesses are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence.

Prior to normal operation, the LPDDR2 device must be initialized. The following section provides detailed information covering device initialization, register definition, command description and device operation.

7.1 Simplified LPDDR2 State Diagram

LPDDR2-SDRAM state diagram provides a simplified illustration of allowed state transitions and the related commands to control them. For a complete definition of the device behavior, the information provided by the state diagram should be integrated with the truth tables and timing specification.

The truth tables provide complementary information to the state diagram, they clarify the device behavior and the applied restrictions when considering the actual state of all the banks.

7.2 Power-up, Initialization, and Power-Off

The LPDDR2 Devices must be powered up and initialized in a predefined manner. Operational procedures other than those specified may result in undefined operation.

7.2.1 Power Ramp and Device Initialization

The following sequence shall be used to power up an LPDDR2 device. Unless specified otherwise, these steps are mandatory.

1. Power Ramp

While applying power (after T_a), CKE shall be held at a logic low level ($\leq 0.2 \times V_{DDCA}$), all other inputs shall be between V_{ILmin} and V_{IHmax} . The LPDDR2 device will only guarantee that outputs are in a high impedance state while CKE is held low.

On or before the completion of the power ramp (T_b) CKE must be held low.

DQ, DM, DQS_t and DQS_c voltage levels must be between V_{SSQ} and V_{DDQ} during voltage ramp to avoid latchup. CK_t, CK_c, CS_n, and CA input levels must be between V_{SSCA} and V_{DDCA} during voltage ramp to avoid latch-up.

The following conditions apply:

T_a is the point where any power supply first reaches 300mV.

After T_a is reached, V_{DD1} must be greater than $V_{DD2} - 200mV$.

After T_a is reached, V_{DD1} and V_{DD2} must be greater than $V_{DDCA} - 200mV$.

After T_a is reached, V_{DD1} and V_{DD2} must be greater than $V_{DDQ} - 200mV$.

After T_a is reached, V_{REF} must always be less than all other supply voltages.

The voltage difference between any of V_{SS} , V_{SSQ} , and V_{SSCA} pins may not exceed 100mV.

The above conditions apply between T_a and power-off (controlled or uncontrolled).

T_b is the point when all supply voltages are within their respective min/max operating conditions. Reference voltages shall be within their respective min/max operating conditions a minimum of 5 clocks before CKE goes high.

For supply and reference voltage operating conditions, see 8.2.1.1 “Recommended DC Operating Conditions” table.

Power ramp duration t_{INIT0} ($T_b - T_a$) must be no greater than 20 mS.

2. CKE and clock

Beginning at T_b , CKE must remain low for at least $t_{INIT1} = 100$ nS, after which it may be asserted high. Clock must be stable at least $t_{INIT2} = 5 \times t_{CK}$ prior to the first low to high transition of CKE (T_c). CKE, CS_n and CA inputs must observe setup and hold time (t_{IS} , t_{IH}) requirements with respect to the first rising clock edge (as well as to the subsequent falling and rising edges).

The clock period shall be within the range defined for t_{CKb} (18 nS to 100 nS), if any Mode Register Reads are performed. Mode Register Writes can be sent at normal clock operating frequencies so long as all AC Timings are met. Furthermore, some AC parameters (e.g. t_{DQSCK}) may have relaxed timings (e.g. t_{DQSCKb}) before the system is appropriately configured.

While keeping CKE high, issue NOP commands for at least $t_{INIT3} = 200$ μ S. (T_d).

3. Reset command

After t_{INIT3} is satisfied, a MRW(Reset) command shall be issued (T_d). The memory controller may optionally issue a Precharge-All command prior to the MRW Reset command. Wait for at least $t_{INIT4} = 1 \mu\text{s}$ while keeping CKE asserted and issuing NOP commands.

4. Mode Registers Reads and Device Auto-Initialization (DAI) polling:

After t_{INIT4} is satisfied (T_e) only MRR commands and power-down entry/exit commands are allowed. Therefore, after T_e , CKE may go low in accordance to Power-Down entry and exit specification (see section 7.4.24 “Power-Down”).

The MRR command may be used to poll the DAI-bit to acknowledge when Device Auto-Initialization is complete or the memory controller shall wait a minimum of t_{INIT5} before proceeding.

As the memory output buffers are not properly configured yet, some AC parameters may have relaxed timings before the system is appropriately configured.

After the DAI-bit (MR#0, “DAI”) is set to zero “DAI complete” by the memory device, the device is in idle state (T_f). The state of the DAI status bit can be determined by an MRR command to MR#0.

The LPDDR2 SDRAM device will set the DAI-bit no later than t_{INIT5} (10 μs) after the Reset command. The memory controller shall wait a minimum of t_{INIT5} or until the DAI-bit is set before proceeding.

After the DAI-Bit is set, it is recommended to determine the device type and other device characteristics by issuing MRR commands (MR0 “Device Information” etc.).

5. ZQ Calibration:

After t_{INIT5} (T_f), an MRW ZQ Initialization Calibration command may be issued to the memory (MR10). This command is used to calibrate the LPDDR2 output drivers (RON) over process, voltage, and temperature. Optionally, the MRW ZQ Initialization Calibration command will update MR0 to indicate RZQ pin connection. In systems in which more than one LPDDR2 device exists on the same bus, the controller must not overlap ZQ Calibration commands. The device is ready for normal operation after t_{ZQINIT} .

6. Normal Operation:

After t_{ZQINIT} (T_g), MRW commands may be used to properly configure the memory, for example the output buffer driver strength, latencies etc. Specifically, MR1, MR2, and MR3 shall be set to configure the memory for the target frequency and memory configuration.

The LPDDR2 device will now be in IDLE state and ready for any valid command.

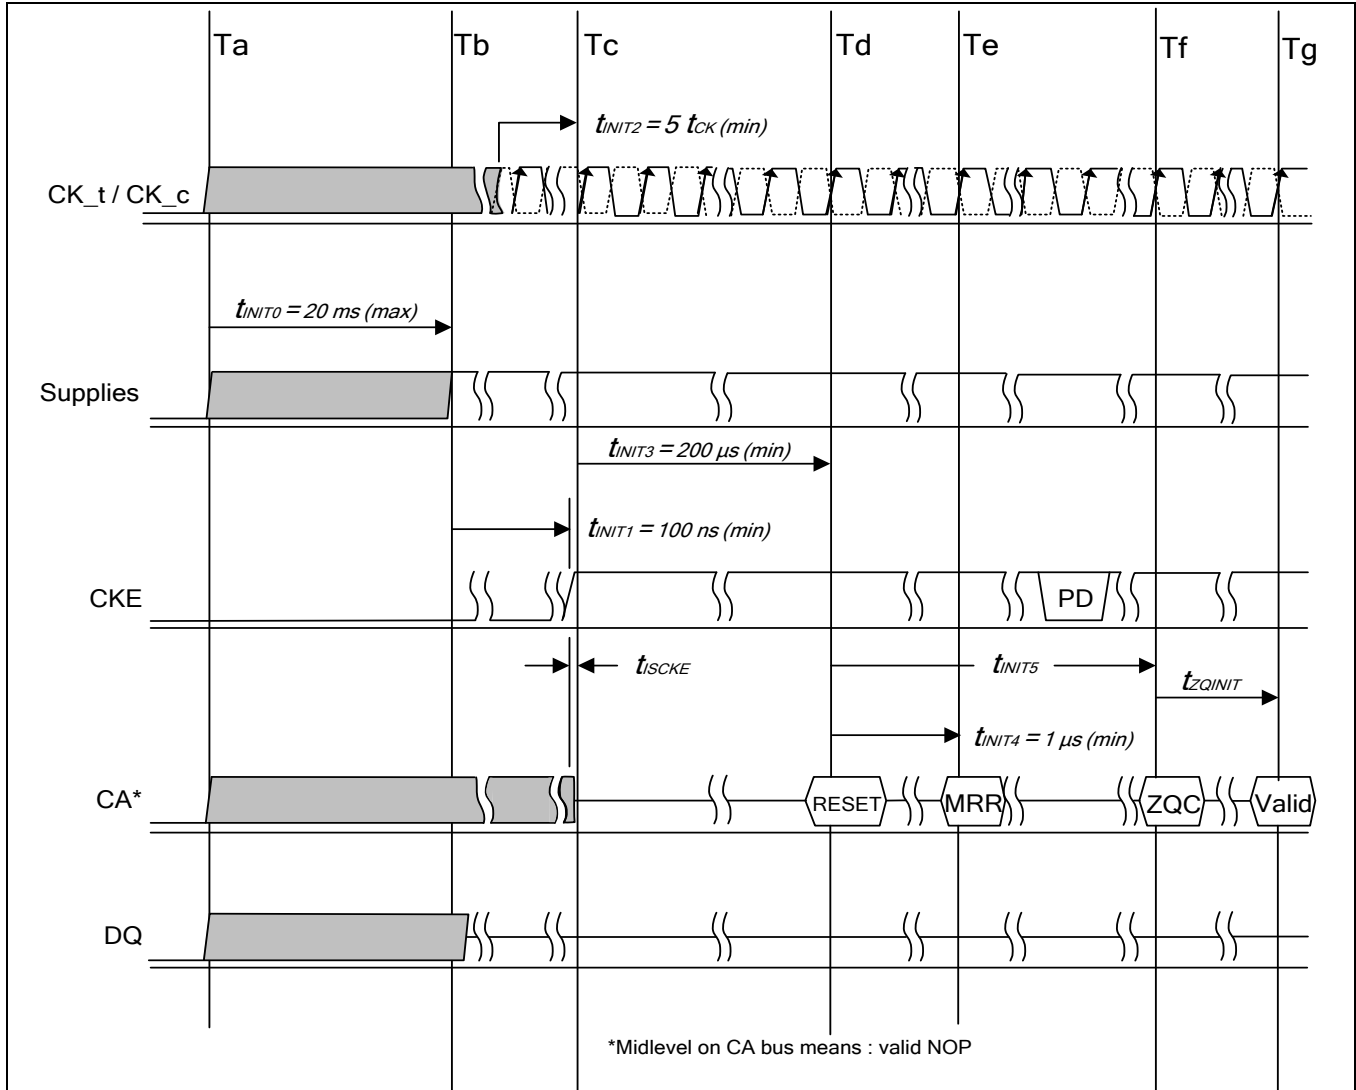

After T_g , the clock frequency may be changed according to the clock frequency change procedure described in section 7.4.26 “Input Clock Stop and Frequency Change”.

7.2.2 Timing Parameters for Initialization

Symbol	Value		Unit	Comment
	min	max		
tINIT0		20	mS	Maximum Power Ramp Time
tINIT1	100		nS	Minimum CKE low time after completion of power ramp
tINIT2	5		tCK	Minimum stable clock before first CKE high
tINIT3	200		μS	Minimum Idle time after first CKE assertion
tINIT4	1		μS	Minimum Idle time after Reset command
tINIT5		10	μS	Maximum duration of Device Auto-Initialization
tzQINIT	1		μS	ZQ Initial Calibration for LPDDR2-S4
tCKb	18	100	nS	Clock cycle time during boot

7.2.3 Power Ramp and Initialization Sequence

7.2.4 Initialization after Reset (without Power ramp)

If the RESET command is issued outside the power up initialization sequence, the reinitialization procedure shall begin with step 3 (Td).

7.2.5 Power-off Sequence

The following sequence shall be used to power off the LPDDR2 device.

While removing power, CKE shall be held at a logic low level ($\leq 0.2 \times VDDCA$), all other inputs shall be between VIL_{min} and VIH_{max} . The LPDDR2 device will only guarantee that outputs are in a high impedance state while CKE is held low.

DQ, DM, DQS_t and DQS_c voltage levels must be between $VSSQ$ and $VDDQ$ during power off sequence to avoid latch-up. CK_t, CK_c, CS_n and CA input levels must be between $VSSCA$ and $VDDCA$ during power off sequence to avoid latch-up.

Tx is the point where any power supply decreases under its minimum value specified in 8.2.1.1 “**Recommended DC Operating Conditions**” table.

Tz is the point where all power supplies are below 300 mV. After Tz, the device is powered off.

The time between Tx and Tz (tPOFF) shall be less than 2s.

The following conditions apply:

Between Tx and Tz, $VDD1$ must be greater than $VDD2 - 200$ mV.

Between Tx and Tz, $VDD1$ and $VDD2$ must be greater than $VDDCA - 200$ mV.

Between Tx and Tz, $VDD1$ and $VDD2$ must be greater than $VDDQ - 200$ mV.

Between Tx and Tz, $VREF$ must always be less than all other supply voltages.

The voltage difference between any of VSS , $VSSQ$, and $VSSCA$ pins may not exceed 100 mV.

For supply and reference voltage operating conditions, see 8.2.1.1 “**Recommended DC Operating Conditions**” table.

7.2.6 Timing Parameters Power-Off

Symbol	Value		Unit	Comment
	min	max		
tPOFF	-	2	s	Maximum Power-Off Ramp Time

7.2.7 Uncontrolled Power-Off Sequence

The following sequence shall be used to power off the LPDDR2 device under uncontrolled condition.

Tx is the point where any power supply decreases under its minimum value specified in the DC operating condition table. After turning off all power supplies, any power supply current capacity must be zero, except for any static charge remaining in the system.

Tz is the point where all power supply first reaches 300 mV. After Tz, the device is powered off.

The time between Tx and Tz (tPOFF) shall be less than 2s. The relative levels between supply voltages are uncontrolled during this period.

$VDD1$ and $VDD2$ shall decrease with a slope lower than 0.5 V/ μ S between Tx and Tz.

Uncontrolled power off sequence can be applied only up to 400 times in the life of the device.

7.3 Mode Register Definition

7.3.1 Mode Register Assignment and Definition

Each register is denoted as “R” if it can be read but not written, “W” if it can be written but not read, and “R/W” if it can be read and written.

Mode Register Read command shall be used to read a register. Mode Register Write command shall be used to write a register.

7.3.1.1 Mode Register Assignment

Notes:

1. RFU bits shall be set to '0' during Mode Register writes.
2. RFU bits shall be read as '0' during Mode Register reads.
3. All Mode Registers that are specified as RFU or write-only shall return undefined data when read and DQS shall be toggled.
4. All Mode Registers that are specified as RFU shall not be written.
5. Writes to read-only registers shall have no impact on the functionality of the device.

7.3.2 MR0_Device Information (MA[7:0] = 00H)

OP7	OP6	OP5	OP4	OP3	OP2	OP1	OP0
(RFU)			RZQI		DNVI	DI	DAI

DAI (Device Auto-Initialization Status)	Read-only	OP0	0b : DAI complete 1b : DAI still in progress
DI (Device Information)	Read-only	OP1	0b : S4 SDRAM
DNVI (Data Not Valid Information)	Read-only	OP2	0b : LPDDR2 SDRAM will not implement DNV functionalit
RZQI (Built in Self Test for RZQ Information)	Read-only	OP[4:3]	00b : RZQ self test not executed. 01b : ZQ-pin may connect to VDDCA or float 10b : ZQ-pin may short to GND 11b : ZQ-pin self test completed, no error condition detected (ZQ-pin may not connect to VDDCA or float nor short to GND)

Notes:

- RZQI will be set upon completion of the MRW ZQ Initialization Calibration command.
- If ZQ is connected to VDDCA to set default calibration by user, OP[4:3] shall be read as 01. If user does not want to connect ZQ pin to VDDCA, but OP[4:3] is read as 01 or 10, it might indicate a ZQ-pin assembly error. It is recommended that the assembly error being corrected first.
- In the case of possible assembly error (either OP[4:3]=01 or OP[4:3]=10 as defined above), the LPDDR2 device will default to factory trim settings for RON, and will ignore ZQ calibration commands. In either case, the system may not function as intended.
- In the case of the ZQ self-test returning a value of 11b, this result indicates that the device has detected a resistor connection to the ZQ pin. However, this result cannot be used to validate the ZQ resistor value or that the ZQ resistor tolerance meets the specified limits (i.e., 240 Ohm \pm 1%).

7.3.3 MR1_Device Feature 1 (MA[7:0] = 01H)

Notes:

1. A Mode Register Read from MR4 will reset OP7 to '0'.
2. OP7 is reset to '0' at power-up.
3. If OP2 equals '1', the device temperature is greater than 85°C.
4. OP7 is set to '1' if OP2:OP0 has changed at any time since the last read of MR4.
5. LPDDR2 might not operate properly when OP[2:0] = 000b or 111b.
6. For specified operating temperature range and maximum operating temperature, refer to "Operating Temperature Conditions" table.
7. LPDDR2 devices must be derated by adding 1.875 nS to the following core timing parameters: tRCD, tRC, tRAS, tRP, and tRRD. tDQSCK shall be de-rated according to the tDQSCK de-rating value in "LPDDR2 AC Timing" table. Prevailing clock frequency spec and related setup and hold timings shall remain unchanged.
8. The recommended frequency for reading MR4 is provided in "Temperature Sensor" section.

------------------	------------	---------	---

Notes:

- Host processor shall not write MR10 with "Reserved" values.
- LPDDR2 devices shall ignore calibration command when a "Reserved" value is written into MR10.
- See AC timing table for the calibration latency.
- If ZQ is connected to VSSCA through RZQ, either the ZQ calibration function (see section 7.4.23 "**Mode Register Write ZQ Calibration Command**") or default calibration (through the ZQreset command) is supported. If ZQ is connected to VDDCA, the device operates with default calibration, and ZQ calibration commands are ignored. In both cases, the ZQ connection shall not change after power is applied to the device.
- Optionally, the MRW ZQ Initialization Calibration command will update MR0 to indicate RZQ pin connection.

7.3.14 MR32_DQ Calibration Pattern A (MA[7:0] = 20H)

Reads to MR32 return DQ Calibration Pattern “A”. See section 7.4.20.2 “DQ Calibration”.

7.3.15 MR40_DQ Calibration Pattern B (MA[7:0] = 28H)

Reads to MR40 return DQ Calibration Pattern “B”. See section 7.4.20.2 “DQ Calibration”.

7.3.16 MR63_Reset (MA[7:0] = 3FH): MRW only

X							

For additional information on MRW RESET see section 7.4.21 “Mode Register Write Command”.

7.4 Command Definitions and Timing Diagrams

7.4.1 Activate Command

The SDRAM Activate command is issued by holding CS_n LOW, CA0 LOW, and CA1 HIGH at the rising edge of the clock. The bank addresses are used to select the desired bank. The row addresses are used to determine which row to activate in the selected bank. The Activate command must be applied before any Read or Write operation can be executed. The LPDDR2 SDRAM can accept a read or write command at time t_{RCD} after the activate command is sent. Once a bank has been activated it must be precharged before another Activate command can be applied to the same bank. The bank active and precharge times are defined as t_{RAS} and t_{RP}, respectively. The minimum time interval between successive Activate commands to the same bank is determined by the RAS cycle time of the device (t_{RC}). The minimum time interval between Activate commands to different banks is t_{RRD}.

7.4.1.1 Activate Command Cycle: t_{RCD} = 3, t_{RP} = 3, t_{RRD} = 2

Note:

A Precharge-All command uses t_{RPab} timing, while a Single Bank Precharge command uses t_{RPpb} timing. In this figure, t_{RP} is used to denote either an All-bank Precharge or a Single Bank Precharge
