Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1. 9XCite RS-232/485 RF Modem

The XCite-PKG-R RS-232/485 RF Modem provides OEMs and system integrators with a low power wireless solution that is easy-to-use.

No configuration is necessary for out-of-box RF operation. Simply feed data into one modem; then the data is sent out the other end of the wireless link. If more advanced functionality is needed, the modem support an extensive set of commands.

The RF modem operates within the ISM 900 MHz frequency band.

1.1. Key Features

Long Range Data Integrity

4 mW Power Output (0 dBm)

- Indoor/Urban: up to 300' (90 m)
- Outdoor RF line-of-sight: up to 1000' (300 m) w/ 2.1 dB dipole antenna

Receiver Sensitivity

- -108 dBm (@ 9600 baud),
- -104 dBm (@ 38400 baud)

Advanced Networking & Security

True Peer-to-Peer (no "master" required), Point-to-Point & Point-to-Multipoint networking

Hopping (Frequency Hopping Spread Spectrum) or Single Frequency Modes

7 hopping channels: each with over 65,000 network addresses available

Up to 9 non-overlapping simultaneous networks

Low Power

Power-down current as low as 1 mA

105 mA transmit / 55 mA receive current consumption

Easy-to-Use

No configuration required

Advanced configurations available through AT commands

7 to 18V power supply

Continuous RF data stream of up to 38.4 kbps

XII™ Interference Immunity

X-CTU Software included

Cover more ground with fewer radio modems due to market-leading range

Free & Unlimited Technical Support

1.1.1. Worldwide Acceptance

FCC Certified (USA) [Refer to Appendix A for FCC Requirements]
Systems that contain XCite Modems inherit MaxStream's FCC Certification

IC (Industry Canada) Certified

ISM (Industrial, Scientific & Medical) license-free 902-928 MHz frequency band

Manufactured under **ISO 9001:2000 registered standards**

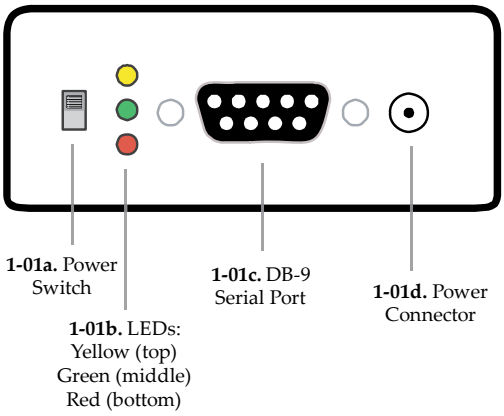
1.2. Specifications

Table 1-01. 9XCite-PKG-R RS-232/485 RF Modem

9XCite 900 MHz RS-232/485 RF Modem Specifications		
Performance		
Transmit Power Output	4mW	
Indoor/Urban Range	Up to 300' (90 m)	
Outdoor RF line-of-sight Range	Up to 1000' (300 m)	
Interface Data Rate (software selectable using BD command)	1200 –57600 bps	
Throughput Data Rate (baud)	**9600 bps**	**38400 bps**
RF Data Rate (baud)	10,000 bps	41,666 bps
Receiver Sensitivity	-108 dBm	-104 dBm
Power Requirements		
Supply Voltage	7 - 18 VDC	
Transmit Current	105 mA	
Receive Current	55 mA	
Power-down Current	< 1 mA	
Networking & Security		
Frequency	902-928 MHz	
Spread Spectrum	Frequency Hopping, Wide band FM modulator	
Modulation	FSK (Frequency Shift Keying)	
Network Topologies Supported	Peer-to-Peer ("Master/Slave" relationship not required), Point-to-Point & Point-to-Multipoint	
Channel Capacity	Hopping Mode - 7 hop sequences share 25 frequencies Single Frequency Mode - 25 available frequencies	
Physical Properties		
RF Modem Board Size	2.75" x 5.50" x 1.124" (7.90 cm x 13.90 cm x3.80 cm)	
Weight	7.1 oz. (200 g), Extruded aluminum, black anodized	
Serial Connector	DB-9	
Operating Temperature	0 to 70º C (commercial)	
Antenna		
Connector	RPSMA (Reverse-polarity SMA)	
Type	Half-wave dipole whip, 6.75" (17.15cm), 2.1 dBi gain	
Impedance	50 ohms unbalanced	
Certifications (partial list)		
FCC Part 15.247	OUR-9XCITE	
Industry Canada (IC)	4214A-9XCITE	

1.3. External Interface

Figure 1-01. Front View



1-01a. Power Switch

Move Power Switch to the ON (up) position to power the XCite RS-232/485 RF Modem.

1-01b. I/O & Power LEDs

LEDs indicate modem activity as follows:

Yellow (top LED) = Serial Data Out (to host)
Green (middle) = Serial Data In (from host)
Red (bottom) = Power/TX Indicator (Red light is on when powered; it pulses on/off briefly during RF transmission.)

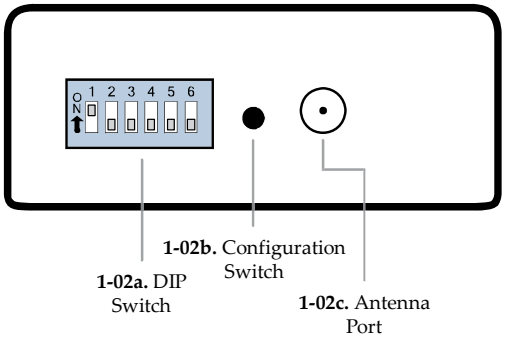
1-01c. DB-9 Serial Port

Standard female RS-232 (DB-9) DCE connector - Port is also used for RS-485 and RS-422 connections.

1-01d. Power Connector*

7-18 VDC Power Connector (Center positive, 5.5/2.1 mm) - Power can also be supplied through Pin 9 of the serial port.

Figure 1-02. Back View



1-02a. DIP Switch

DIP Switch automatically configures the XCite Module to operate in different modes. Each time the RF modem is powered-on, intelligence on the XIB-R interface board programs the embedded module according to the positions of the DIP Switch. [See the figure below for DIP Switch settings.]

In cases where AT Commands should not be sent each time the RF Modem is powered on, the processor must be disabled by populating J7 on the interface board. [See "Automatic DIP Switch Configurations" section for more information].

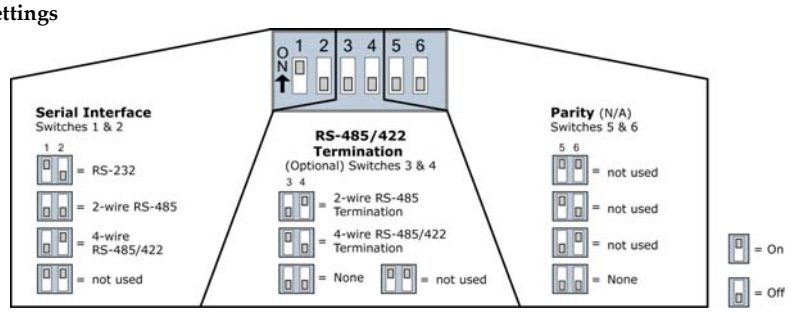
1-02b. Config (Configuration) Switch

Configuration Switch provides an alternate way to enter "AT Command Mode". To enter "AT Command Mode" at the RF modem's default baud rate, hold the Configuration Switch down while powering on the modem using the Power Switch.

1-02c. Antenna Port

This port is a 50 Ohm RF signal connector for connecting to an RPSMA (Reverse Polarity SMA) type antenna. The RPSMA has threads on the outside of a barrel and a male center conductor.

Figure 1-03. DIP Switch Settings



2. Interfacing Protocol

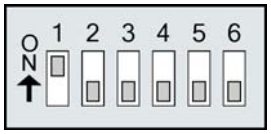
The 9XCite RS-232/485 RF Modem supports the following interfacing protocols:

- RS-232
- RS-485 (2-wire) Half-duplex
- RS-485 (4-wire) and RS-422

2.1. RS-232 Operation

2.1.1. DIP Switch Settings and Pin Signals

Figure 2-01.
RS-232 DIP Switch Settings



DIP Switch settings are read and applied only while powering-on.

Figure 2-02.
Pins used on the female RS-232 (DB-9) Serial Connector

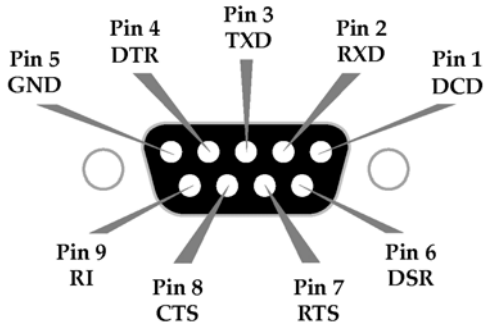


Table 2-01. RS-232 Signals and their implementations on the XCite RF Modem
(Low-asserted signals are distinguished by horizontal line over pin name.)

DB-9 Pin	RS-232 Name	Pin Reference Name*	Description	Implementation
1	DCD	DO2	Data-Carrier-Detect	Connected to DSR (pin6)
2	RXD	DO	Received Data	Serial data exiting the RF modem (to host)
3	TXD	DI	Transmitted Data	Serial data entering into the RF modem (from host)
4	DTR	DI2	Data-Terminal-Ready	Can enable Power-Down on the RF modemy
5	GND	-	Ground Signal	Ground
6	DSR	DO2	Data-Set-Ready	Connected to DCD (pin1)
7	$\overline{\text{RTS}}$ / CMD	DI1	Request-to-Send / Command Mode	Provides $\overline{\text{RTS}}$ flow control or enables Command Mode
8	$\overline{\text{CTS}}$	DO1	Clear-to-Send	Provides $\overline{\text{CTS}}$ flow control
9	RI	-	Ring Indicator	Optional power input that is connected internally to the positive lead of the front power connector

* The 'Pin Reference Name' provides an associative tag that references commands used to define pin behaviors. GPI stands for "General Purpose Input" and GPO stands for "General Purpose Output". As an example, the CD command is used to define the behavior of GPO2 (DB-9 pin number 1). The 'Pin Reference Name' is the name used when referring to XCite commands and parameters.

2.1.2. Wiring Diagrams

Figure 2-03. RS-232 DTE Device (male DB-9 connector) wired to a DCE RF modem (female DB-9)

Pins used on the female RS-232 (DB-9)
Serial Connector

Table 2-03. RS-485/422 (4-wire) Signals and their implementations on the XCite RF Modem

DB-9 Pin	RS-485/422 Name	Description	Implementation
2	T- (TA)	Transmit Negative Data Line	Serial data sent from the RF modem
3	R- (RA)	Receive Negative Data Line	Serial data received by the RF modem
5	GND	Signal Ground	Ground
7	R+ (RB)	Receive Positive Data Line	Serial data received by the RF modem
8	T+ (TB)	Transmit Positive Data Line	Serial data sent from the RF modem
9	PWR	Power	Optional power input that is connected internally to the front power connector
1, 4, 6	not used		

2.3.2. Wiring Diagrams

Figure 2-13. XCite RF Modem in an RS-485 (4-wire) environment

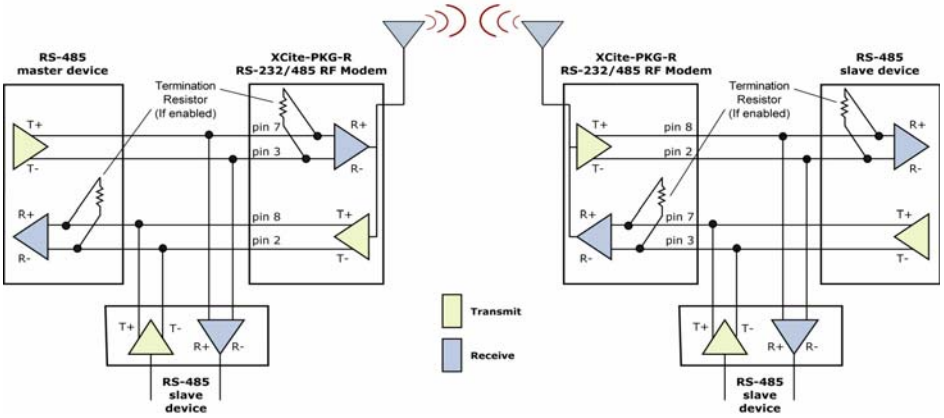

Figure 2-14. XCite RF Modem in an RS-422 environment

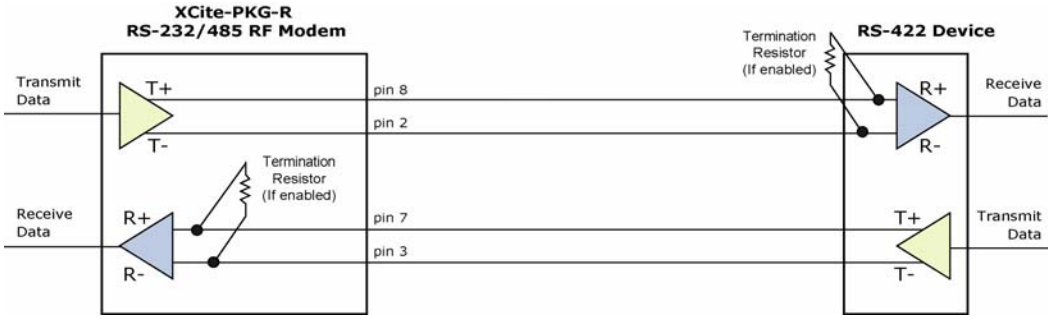

RS-485/422 Connection Guidelines

The RS-485/422 protocol provides a solution for wired communications that can tolerate high noise and push signals over long cable lengths. RS-485/422 signals can communicate as far as 4000 feet (1200 m). RS-232 signals are suitable for cable distances up to 100 feet (30.5 m).

RS-485 offers multi-drop capability in which up to 32 nodes can be connected. The RS-422 protocol is used for point-to-point communications.

Suggestions for integrating the XCite RF Modem with the RS-485/422 protocol:

1. When using Ethernet twisted pair cabling: Select wires so that T+ and T- are connected to each wire in a twisted pair. Likewise, select wires so that R+ and R- are connected to a twisted pair. (For example, tie the green and white/green wires to T+ and T-.)
2. For straight-through Ethernet cable (not cross-over cable) - The following wiring pattern works well: Pin3 to T+, Pin4 to R+, Pin5 to R-, Pin6 to T-
3. Note that the connecting cable only requires 4 wires (even though there are 8 wires).
4. When using phone cabling (RJ-11) - Pin2 in the cable maps to Pin3 on opposite end of cable and Pin1 maps to Pin4 respectively.

Figure 2-15. Male DB-9 to RJ-45 Adapter (yellow)

An XCite RS-232/485 RF Modem 'Accessories Kit' is available that includes connectors that facilitate RS-485/422 and other serial communications.

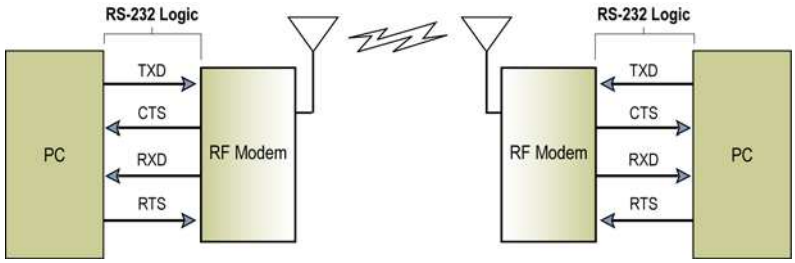
3. RF Modem Operation

3.1. Serial Communications

3.1.1. RS-232 and RS-485/ 422 Data Flow

The XCite RF Modem can enable a host device to communicate wirelessly. To transmit, the host device simply sends serial data to the XCite RF Modem pins. The RF modem then converts the data into FCC-approved RF data. Once transmitted, the RF data can be detected by receiving XCite RF Modems, checked for integrity and then sent to a receiving device.

Figure 3-01. Data Flow in RS-232 and RS-485/422 environments.
(Low-asserted signals distinguished with a horizontal line over signal name.)

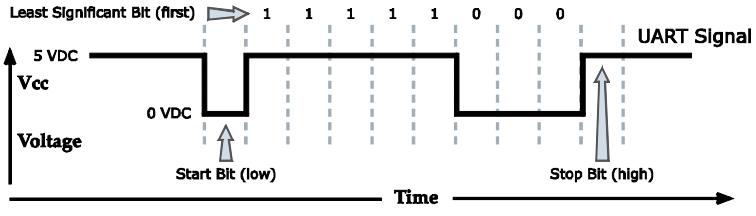


3.1.2. Serial Data

Data enters the MaxStream RF modem through the DI Pin as an asynchronous serial signal. The signal should idle high when no data is being transmitted.

The UART performs tasks (such as timing and parity checking) needed for communication. Serial communication consists of two UARTs which must be configured with compatible parameters (Baud rate, parity, start bits, stop bits, data bits) to have successful communication. Each data packet consists of a start bit (low), 8 data bits (least significant bit first) and a stop bit (high). The following figure illustrates the serial bit pattern of data passing through the modem.

Figure 3-02. Serial (UART) data packet 0x1F (decimal "31") as transmitted through the XCite Module
Data Format is 8-N-1 (8 bits - No Parity - 1 Stop Bit)

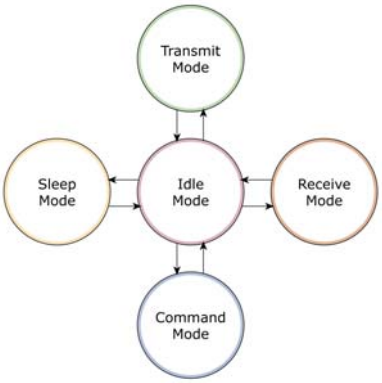


In the example above, the MaxStream RF modem transfer 8 bits over-the-air [Selectable using BI (Number of Bits) Parameter]. Start and stop bits of the UART signal are not transmitted over-the-air, but are regenerated by the receiving modem

3.2. Modes of Operation

XCite RF Modems operate in five modes.

Figure 3-03. Modes of Operation



3.2.1. Idle Mode

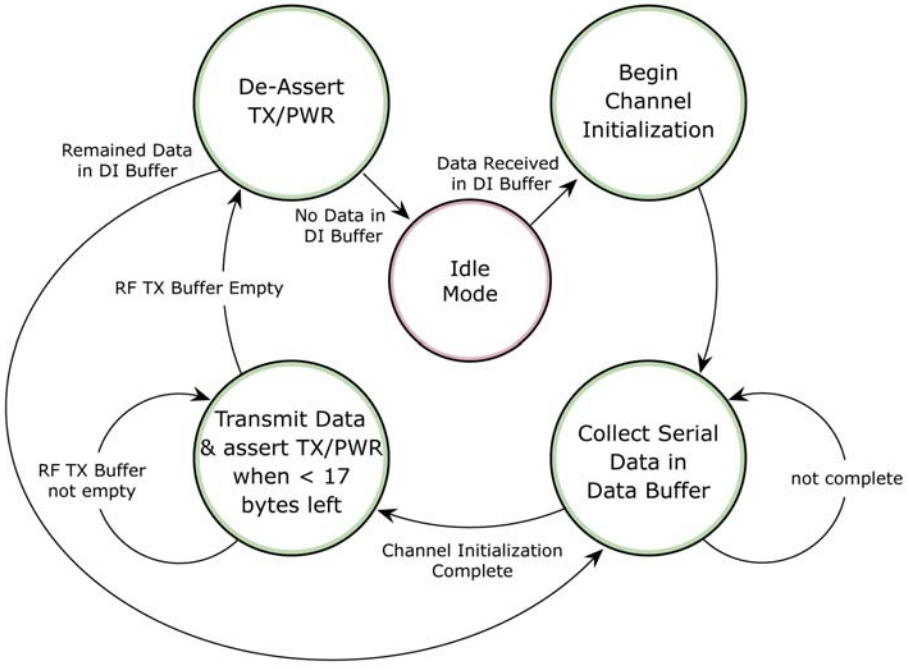
When not receiving or transmitting data, the RF modem is in Idle Mode. The modem shifts into the other modes of operation under the following conditions:

- Transmit Mode (Serial data is received in the DI Buffer)
- Receive Mode (Valid RF data is received through the antenna)
- Sleep Mode (Sleep Mode condition is met)
- Command Mode (Command Mode Sequence is issued)

3.2.2. Transmit Mode

When the first byte of serial data comes through the DI Pin and arrives in the DI Buffer, the modem transitions into Transmit Mode. Once in Transmit Mode, the modem initializes a communications channel. During channel initialization, incoming serial data accumulates in the DI buffer. After the channel is initialized, data in the DI buffer is grouped into packets (up to 64 bytes in each packet) and is transmitted. The modem continues to transmit data packets until the DI buffer is empty. Once transmission is finished, the modem returns to Idle Mode. This progression is shown below:

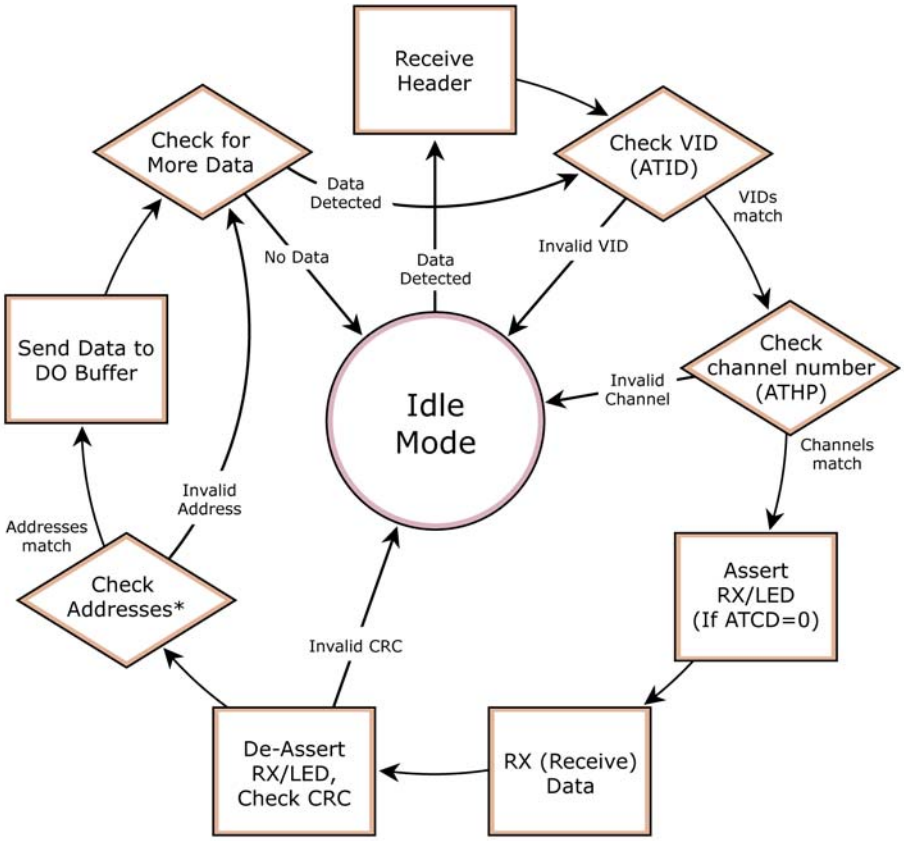
Figure 3-04. Transmission of data



3.2.3. Receive Mode

If a modem detects RF transmitted data while operating in Idle Mode, it transitions into Receive Mode to start receiving packets. Once a packet is received, it goes through the receiving-end of a CRC (cyclic redundancy check) to ensure that the data was transmitted without error. If the CRC data bits on the incoming packet are invalid, the packet is discarded. If the CRC is valid, the packet is placed the DO Buffer. This process is shown in the figure below:

Figure 3-05. Receive Mode Data Flow



The modem returns to Idle Mode after valid data is no longer detected or once an error is detected in the received data. If serial data-to-transmit is stored in the DI buffer while the modem is giving precedence to Receive Mode, the data will be transmitted after the modem finishes receiving data and returns to Idle Mode.

3.2.4. Sleep Modes

Software Sleep

Sleep Modes enable the modem to enter states of low-power consumption when not in use. Three software Sleep Modes are supported:

- Pin Sleep (Host Controlled)
- Serial Port Sleep (Wake on Serial Port activity)
- Cyclic Sleep (Wake on RF activity)

In order to enter Sleep Mode, one of the following conditions must be met (in addition to the modem having a non-zero SM parameter value):

1. The modem is idle (no data transmission or reception) for the amount of time defined by the ST (Time before Sleep) parameter.
2. SLEEP pin is asserted.

Once in Sleep Mode, the radio modem does not transmit or receive data until it first returns to Idle Mode. The return into Idle Mode is triggered by the de-assertion of the Sleep pin or the arrival of a serial byte through Data In pin.

The SM (Sleep Mode) command is central to setting all Sleep Mode configurations. By default, Sleep Modes are disabled (SM = 0) and the modem remains in Idle/Receive Mode. When in this state, the modem remains constantly ready to respond to serial or RF activity.

Pin Sleep (SM = 1)

- Pin/Host-controlled

<Lowest Power Configuration> In order to achieve this low-power state, Pin 2 must be asserted (high). The modem remains in Pin Sleep until the Sleep pin is de-asserted. The modem will complete a transmission or reception before activating Pin Sleep.

After enabling Pin Sleep (SM (Sleep Mode) Parameter = 1), Pin 2 controls whether the XCite Module is active or in Sleep Mode. When Pin 2 is asserted (high), the modem transitions to Sleep Mode and remains in its lowest power-consuming state until the Sleep pin is de-asserted. The XCite Module requires 40ms to transition from Sleep Mode to Idle Mode. Pin 2 is only active if the modem is setup to operate in this mode; otherwise the pin is ignored. Once in Pin Sleep Mode, $\overline{\text{CTS}}$ is de-asserted (high), indicating that data should not be sent to the modem. The PWR pin is also de-asserted (low) when the modem is in Pin Sleep Mode

Note: The modem will complete a transmission or reception before activating Pin Sleep.

Serial Port Sleep (SM = 2)

- Wake on serial port activity

Serial Port Sleep is a Sleep Mode setting in which the modem runs in a low power state until data is detected on the DI pin.

When Serial Port Sleep is enabled, the modem goes into Sleep Mode after a user-defined period of inactivity (no transmitting or receiving of data). This period of time is determined by ST (Time before Sleep) Command. The modem returns to Idle Mode once a character is received through the DI pin.

Cyclic Sleep (SM = 3-8)

Cyclic Sleep is the Sleep Mode setting in which the XCite Module enters into a low power state and awakens periodically to determine if any transmissions are being sent.

When Cyclic Sleep settings are enabled, the XCite Module goes into Sleep Mode after a user-defined period of inactivity (no transmission or reception on the RF channel). The user-defined period is determined by ST Parameter. [See ST (Time before Sleep) Parameter]

While the modem is in a low-power state, $\overline{\text{CTS}}$ de-asserted (high) to indicate that data should not be sent to the modem during this time. When the modem awakens to listen for data, $\overline{\text{CTS}}$ is asserted and any data received on the DI Pin is transmitted. The PWR pin is also de-asserted (low) when the modem is in Cyclic Sleep Mode. These pins are asserted each time the modem cycles

into Idle Mode to listen for valid data packets and de-asserts when the modem returns to Sleep Mode.

The modem remains in Sleep Mode for a user-defined period of time ranging from 0.5 seconds to 16 seconds (SM Parameters 3 through 8). After this interval of time, the modem returns to Idle Mode and listens for a valid data packet for 100 ms. If the modem does not detect valid data (on any frequency), the modem returns to Sleep Mode. If valid data is detected, the modem transitions into Receive Mode and receives the incoming packets. The modem then returns to Sleep Mode after a Period of inactivity that is determined by ST "Time before Sleep" Parameter.

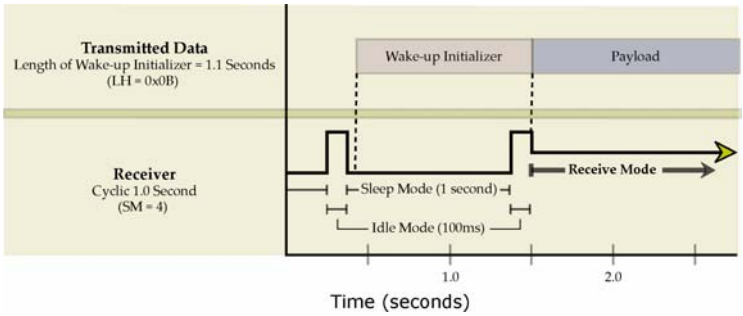
The modem can also be configured to Wake-up from cyclic sleep when the SLEEP pin is de-asserted (low). To configure a modem to operate in this manner, PW (Pin Wake-up) Command must be issued. Once the Sleep pin is de-asserted, the modem is forced into Idle Mode and can begin transmitting or receiving data. It remains active until no data is detected for the period of time specified by the ST parameter, at which point it resumes its low-power cyclic state.

Note: The cyclic interval time defined by SM (Sleep Mode) Command must be shorter than the interval time defined by LH ("Wake-up Initializer Timer") Command. For example: If SM=4 (Cyclic 1.0 second sleep), the LH Parameter should equal 0xB ("1.1" seconds). With these parameters set, there is no risk of the receiving modem being asleep for the duration of the wake-up initializer transmission. The following section "Cyclic Scanning" explains in further detail the relationship between "Cyclic Sleep" and "Wake-up Initializer Timer"

Cyclic Scanning. Each RF transmission consists of a wake-up initializer and payload data. The wake-up initializer contains initialization information and all receiving modems must Wake-up during the wake-up initializer portion of data transmission in order to synchronize with the transmitter and receive the data.

The cyclic interval time defined by the SM (Sleep Mode) command must be shorter than the interval time defined by LH (Wake-up Initializer Timer) command.

Figure 3-06. Correct Configuration (LH > SM):
The length of the wake-up initializer exceeds the time interval of Cyclic Sleep. The receiver is guaranteed to detect the wake-up initializer and receive the accompanying payload data.



3.2.5. Command Mode

AT Command Mode provides access to AT-Settable parameters. These parameters extend flexibility in configuring modems to fit specific design criteria such as networking modems. Not all of the parameters in the XCite Module can be adjusted using AT Commands.

AT Command Mode

To Enter AT Command Mode:

1. Send the 3-character command sequence "+++" and observe guard times before and after the command characters. [refer to 'Default AT Command Mode Sequence' below.] The 'Terminal' tab (or other serial communications software) of the X-CTU Software can be used to enter the sequence.

   [OR]

2. Assert (low) the $\overline{\text{CONFIG}}$ pin and turn the power going to the RF modem off and back on. To achieve this result, simultaneously press the Reset and Config switches [Figure 1-02]; release the Reset Switch; then after 1 second, release the Config Switch. The RF Modem then enters AT Command Mode at the modem's default baud rate

Default AT Command Mode Sequence (for transition to Command Mode):

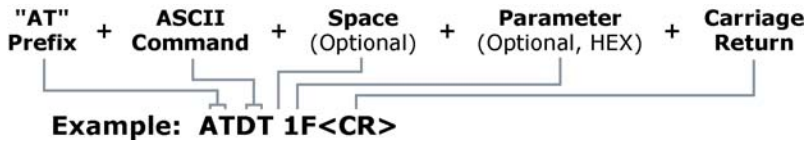
- No characters sent for one second [refer to the BT (Guard Time Before) Command]
- Input three plus characters ("+++") within one second
  [refer to the CC (Command Sequence Character) Command.]
- No characters sent for one second [refer to the AT (Guard Time After) Command.]

All of the parameter values in the sequence can be modified to reflect user preferences.

To Send AT Commands:

Send AT commands and parameters using the syntax shown below.

Figure 3-07. Syntax for sending AT Commands



To read a parameter value stored in the modem register, leave the parameter field blank.

The preceding example would change the modem's Destination Address to "0x1F". To store the new value to non-volatile (long term) memory, the Write (ATWR) command must subsequently be sent before powering off the modem.

System Response. When a command is sent to the modem, the modem will parse and execute the command. Upon successful execution of a command, the modem returns an "OK" message. If execution of a command results in an error, the modem returns an "ERROR" message.

To Exit AT Command Mode:

1. If no valid AT Commands are received within the time specified by CT (Command Mode Timeout) Command, the modem automatically returns to Idle Mode.

   [OR]

2. Send ATCN (Exit Command Mode) Command.

For an example of programming the RF modem using AT Commands and descriptions of each configurable parameter, refer to the "RF Modem Configuration" chapter.

4. RF Modem Configuration

The following versions of the XCite RF Modem are available:

- 900 MHz, 9600 Baud (RF data rate), Hopping Channel Mode
- 900 MHz, 9600 Baud, Single Channel mode
- 900 MHz, 38400 Baud, Hopping Channel mode
- 900 MHz, 38400 Baud, Single Channel mode

XCite Modems can operate in both Single Channel and Hopping modes. Mode is selectable using the "Function Set" dropdown list of the "XCite Configuration" tab of the MaxStream-provided X-CTU Software.

The XCite Module is shipped with a unique parameter set in its memory. Parameters within the set are organized under the following categories: AT Commands & Non-AT Settable Parameters.

4.1. Command and Parameter Types

4.1.1. AT Commands

AT Commands can be changed at any time by entering AT Command Mode and sending commands to the modem.

AT Commands can be modified using the any of the following means:

- X-CTU Software "Modem Configuration" tab
- X-CTU Software "Terminal" tab
- Terminal software program (such as "HyperTerminal")
- Microcontroller

4.1.2. Non-AT Settable Parameters (X-CTU Software configurable only)

Non-AT Settable Parameters can only be adjusted using the MaxStream-provided X-CTU Software. To modify Non-AT Settable Parameter, connect the module to the serial com port of a PC (interface board is necessary for RS-232 connection) and modify parameter values through the X-CTU Software interface. These parameters enable features that need to be set before the module is used in the field.

Non-AT Settable Parameters can only be modified using the following means:

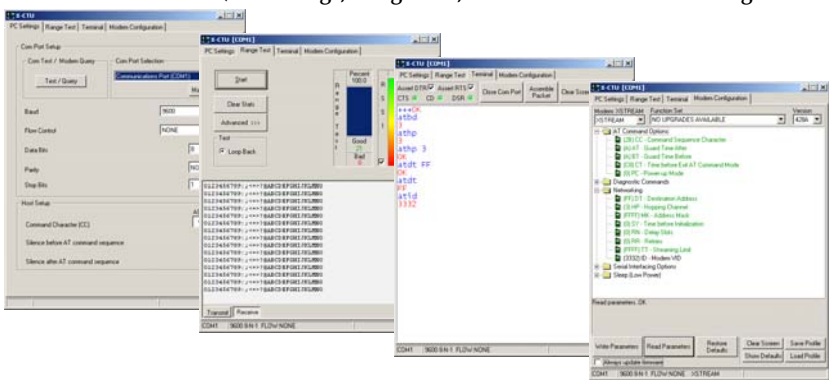
- X-CTU Software "Modem Configuration" tab

4.2. Configuration Software

X-CTU is a MaxStream-provided software program used to interface with and configure MaxStream RF Modems. The software application is organized into the following four tabs:

- PC Settings tab - Setup PC serial ports for interfacing with an RF modem
- Range Test tab - Test the RF modem's range and monitor packets sent and received
- Terminal tab - Set and read RF modem parameters using AT Commands
- Modem Configuration tab - Set and read RF modem parameters

Figure B-1. X-CTU User Interface (PC Settings, Range Test, Terminal and Modem Configuration tabs)



NOTE: PC Setting values are visible at the bottom of the Range Test, Terminal and Modem Configuration tabs. A shortcut for editing PC Setting values is available by clicking on any of the values.

Installation

Double-click the "setup_X-CTU.exe" file and follow prompts of the installation screens. This file is located in the 'software' folder of the MaxStream CD and also under the 'Downloads' section of the following web page: www.maxstream.net/support/downloads.php

Setup

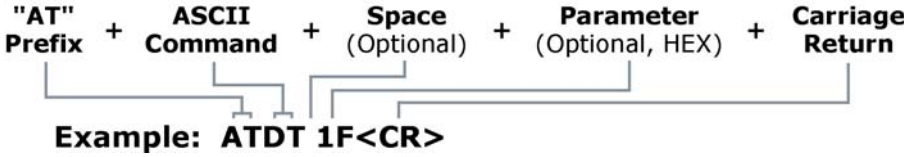
To use the X-CTU software, a module assembly (An RF modem mounted to an interface Board) must be connected to a serial port of a PC.

NOTE: Failure to enter AT Command Mode is most commonly due to baud rate mismatch. The interface data rate and parity settings of the serial port ("PC Settings" tab) must match those of the module (BD (Baud Rate) and NB (Parity) parameters respectively).

Serial Communications Software

A terminal program is built into the X-CTU Software. Other terminal programs such as "HyperTerminal" can also be used to configure modems and monitor communications. When issuing AT Commands through a terminal program interface, use the following syntax:

Figure B-2. Syntax for sending AT Commands



NOTE: To read a parameter value stored in a register, leave the parameter field blank.

The example above issues the DT (Destination Address) command to change destination address of the modem to "0x1F". To save the new value to the modem's non-volatile memory, issue WR (Write) command after modifying parameters.

4.3. Command Reference Tables

XCite AT Commands [below] and Non-AT Settable Parameters [next page] are organized under the following

command categories:

- AT Command Mode Options
- Diagnostic
- Networking
- Serial Interfacing
- Sleep Mode (Low Power)

Table 4-01. AT Commands

(Settable/Readable using X-CTU Software, serial communications software or microcontroller)

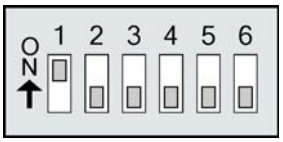
AT Designator	Command Name & Description	Parameter Range	Command Category	# Bytes Returned	Factory Default
CD	DI3 Configuration. Redefines the RX LED I/O line (RX LED signal).	0 – 2 0 = RX LED 1 = high 2 = low	Serial Interfacing	1	0
CN	Exit AT Command Mode. Explicitly exit radio modem from AT Command Mode and return it to Idle Mode.	--	AT Command Mode Options	--	--
CS	DO2 Configuration. Select behavior of DI2 (Digital Output 2) between CTS and RS-485 options.	0 – 4 0 = normal CTS 1 = RS-485 enable low 2 = high 3 = RS-485 enable high 4 = low	Serial Interfacing	1	0
DB	Receive Signal Strength. Returns the signal strength (in decibels) of the last received packet.	0x25 – 0x6A [Read-only]	Diagnostic	1	--
DT	Destination Address. Set the address that identifies the destination of the RF packet. Only radio modems having matching addresses can communicate with each other.	0 – 0xFFFF	Networking	2	0
FH	Force Wake-up Initializer. Force a Wake-up Initializer to be sent on the next transmission. WR (Write) Command does not need to be issued with FH Command. Use only with cyclic sleep modes (SM = 3-8) active on remote modems.	--	Sleep (Low Power)	--	--
HP	Channel *. Select “Hopping” or “Single Frequency” channel on which the radio modem is to communicate. Channels are not noninterfering.	Hopping: 0 – 6 Single Frequency): 0 – 0x18	Networking	1	0
HV	Hardware Version. Read the hardware version of the modem.	Range: 0 – 0xFFFF [Read-only]	Diagnostic	2	--
MK	Address Mask. Set address mask to configure local and global address space.	0 – 0xFFFF	Networking	2	0xFFFF (65535d)
RE	Restore Defaults. Restore AT-settable parameters to the factory default configuration.	--	(Special)	--	--
SH	Serial Number High. Read High 16 bits of unique serial number of radio modem.	0 – 0xFFFF [Read-only]	Diagnostic	2	--
SL	Serial Number Low. Read Low 16 bits of unique serial number of radio modem.	0 – 0xFFFF [Read-only]	Diagnostic	2	--
VR	Firmware Version. Read firmware version currently loaded on radio modem.	0 – 0xFFFF [Read-only]	Diagnostic	2	--
WR	Write. Write parameters to radio modem’s non-volatile memory in order for changes to persist through next power-up or reset.	--	(Special)	--	--

Table 4-02. Non-AT Settable Parameters

(Settable/Readable using the X-CTU Software "Modem Configuration" tab only)

AT Designator	Command Name & Description	Parameter Range	Command Category	# Bytes Returned	Factory Default
AT	Guard Time After. Set required DI pin silent time after the Command Sequence Characters of the AT Command Mode Sequence (BT+ CC + AT).	0x02 – 0xFFFF [x 1 ms]	AT Command Mode Options	2	0x1F4 (500d)
BD	Interface Data Rate. Set serial data rate (baud rate at which radio modem interfaces with host). Serial data rate is different than RF data rate which is fixed and factory-set. If the serial data rate is set higher than RF data rate, flow control may need to be observed to prevent DI buffer overrun.	0 – 6 (1200 - 57600 bps)	Serial Interfacing	1	Set to equal radio modem's fixed RF data rate.
BI	Number of Bits. (7 or 8) – Sets number of data bits per character (bits between start and stop bits).	0 – 1 0 = 7 bits 1 = 8 bits	Serial Interfacing	1	1
BT	Guard Time Before. Set required DI pin silent time before the Command Sequence Characters of the Command Mode Sequence (BT+ CC + AT).	0 – 0xFFFF [x 1 ms]	AT Command Mode Options	2	0x1F4 (500d)
CC	Command Sequence Character. Set the ASCII character to be used between Guard Times of the AT Command Mode Sequence (BT+ CC + AT). The AT Command Mode Sequence enters the radio modem to AT Command Mode (from Idle Mode).	0x20 – 0x7F	AT Command Mode Options	1	0x2B (plus sign (+) in ASCII)
CT	Time before Exit AT Command Mode. Set time period of inactivity (no valid commands received) after which radio modem automatically exits from AT Command Mode.	0x02 – 0xFFFF [x 100 ms]	AT Command Mode Options	2	0xC8 (200d)
FL	Software Flow Control. Enable serial software flow control on the radio modem. (Hardware flow control ($\overline{CTS}$) is on by default.)	0 - 1 0 = disable 1 = enabled	Serial Interfacing	1	0
HT	Time before Wake-up Initializer. Set time period of inactivity (no serial or RF data is sent or received) before a Wake-up Initializer is sent. Base station tracks awake-status of remote radios. HT of base radio should be set shorter than ST of remote radios.	0 – 0xFFFF [x 100 ms]	Sleep (Low Power)	2	0xFFFF (no wake-up Initializer will be sent)
ID	Modem VID. Read radio modem VID (Vendor Identification Number). Only radio modems with matching VIDs can communicate with each other.	0 – 0x7FFF (above this range is Read-only)	Networking	2	0x3332
LH	Wake-up Initializer Time. Set time of the Wake-up Initializer used to wake remote radios that are in cyclic sleep mode. Time of Wake-up Initializer should be longer than that of the remote radio's cyclic sleep cycle (SM 3 - 8).	0 – 0xFF [x 100 ms]	Sleep (Low Power)	1	1
NB	Parity. Select parity format. Settings 0-4 transfer only 8 bits out the antenna port and generate the parity bit on the radio modem receiving side.	0 – 4 0 = 8-none-1, 7-any-1 1 = 8-even-1 2 = 8-odd-1 3 = 8-mark-1, 8-none-2 4 = 8-space-1	Serial Interfacing	1	0
PW	Pin Wake-up. Enable pin wake-up from Cyclic Sleep Mode.	0 – 1 0 = disabled 1 = enabled	Sleep (Low Power)	1	0
RT	DI2 Configuration. Enable $\overline{RTS}$ Mode	0 - 1 0 = Disabled 1 = $\overline{RTS}$ flow control	Serial Interfacing	1	0
SB	Stop Bits. Set number of stop bits.	0 – 1 0 = 1 stop bit 1 = 2 stop bits	Serial Interfacing	1	0
SM	Sleep Mode. Specify Sleep Mode settings.	0 – 8 0 = No sleep 1 = Pin Sleep 2 = Serial Port Sleep 3 to 8 = Cyclic intervals ranging from 0.5 to16.0 seconds	Sleep (Low Power)	1	0
ST	Time before Sleep. Set time period of inactivity (no serial or RF data is sent or received) before activating Sleep Mode. Use with Cyclic Sleep and Serial Port Sleep [refer to SM Command]	0x10 – 0xFFFF [x 100 ms]	Sleep (Low Power)	2	0x64 (100d)

4.4. Automatic DIP Switch Configurations



Each time the RF Modem is powered-on, intelligence on the MaxStream Interface Board (located inside the RF Modem) sends AT Commands that program the modem based on positions of the DIP Switch. Automatic configurations that take place during the power-on sequence affect RF Modem parameter values as shown below.

To avoid overwriting previously stored custom configurations (due to the automatic configurations that take place each time the RF Modem is powered-on), it is necessary to disable a processor located on the XIB-R interface board. To disable the processor, populate J7 of the XIB-R Interface Board. (By default, J7 jumper is not populated.)

Table 4-03. RF Modem Power-up Options (J7 jumper and Config Switch)

Condition	Behavior
If J7 is populated	Processor is disabled and AT Commands are not sent to the RF Modem
If Config Switch is pressed	Processor is disabled and RF Modem enters into AT Command Mode
If J7 is NOT populated and Config Switch is NOT pressed	Execute logic as shown in Table 6.

AT Commands Sent as result of DIP Switch Settings (SW = DIP Switch)

Condition	Behavior
Serial Interfacing Options	
If SW1 is ON (up)	AT Commands sent: ATCS 0 (RS-232 Operation: $\overline{\text{CTS}}$ function for $\overline{\text{CTS}}$ line) ATCD 2 (DO3 - RX LED = low)
If SW1 is OFF (down)	AT Commands sent: ATCS 3 (RS-485 or RS-422 Operation) ATCD 2 (DO3 - RX LED = low)
Exit AT Command Mode	
Always	AT Commands sent: ATCN (Exit AT Command Mode)

4.5. Command Descriptions

Commands and parameters are listed alphabetically. Parameter types and categories are designated between "< >" symbols. For example: <AT Command: Networking>. "AT Command" is the command/parameter type and "Networking" is the command/parameter category.

AT (Guard Time After) Parameter

<Non-AT Settable Parameter: AT Command Options> AT Parameter is used to set the DI pin silent time that follows the command sequence character (CC Parameter). By default, 1 half of a second (500 milliseconds) must elapse before entering another character. The AT Command Mode Sequence used to enter AT Command Mode is as follows:

"No characters sent for 1 millisecond [BT (Guard Time Before) Parameter]
"Send three plus characters "+++" [CC (Command Sequence Character) Parameter]
"No characters sent for 1 millisecond [AT (Guard Time After) Parameter]

All of the values in this sequence can be adjusted. AT Parameter is used to adjust the period of silence that follows the command sequence character.

Parameter Range: 0x02 - 0xFFFF (x 1 millisecond)

# of bytes returned: 2

Default Parameter Value: 0x1F4 (500 decimal)

Related Commands: BT (Guard Time Before), CC (Commands Sequence Character)

BD (Interface Data Rate) Parameter

<Non-AT Settable Parameter: Serial Interfacing> BD Parameter allows the user to adjust the UART baud rate and thus modify the rate at which serial data is sent to the modem. Baud rates range from 1200 to 57600 baud (bps). The new baud rate does not take effect until CN (Exit AT Command Mode) Command is issued.

Note: If the serial data baud rate is set to exceed the fixed RF data baud rate of the XCite radio modem, flow control may need to be implemented.

Parameter Ranges: 0 – 6

Parameter	Configuration (bps)
0	1200
1	2400
2	4800
3	9600
4	19200
5	38400
6	57600

Default Parameter Value: Set to equal radio modem's fixed RF data rate (baud)

Number of bytes returned: 1

BI (Number of Bits) Parameter

<Non-AT Settable Parameter: Serial Interfacing> BI Parameter allows the user to define the number of data bits between the start and stop bits. Setting 7 bits and Mark or Space parity (NB Parameter) will result in a setting of 7 bits and no parity.

Parameter Ranges: 0 – 1

Parameter	Configuration
0	7 bits
1	8 bits

Default Parameter Value: 1

Number of bytes returned: 1

BT (Guard Time Before) Parameter

<Non-AT Settable Parameter: AT Command Options> BT Parameter is used to set the DI pin silent time that precedes the command sequence character (CC Parameter). By default, 1 half of a second (500 milliseconds) must elapse before entering another character. The AT Command Mode Sequence used to enter AT Command Mode is as follows:

"No characters sent for 1 millisecond [BT (Guard Time Before) Parameter]
"Send three plus characters "+++" [CC (Command Sequence Character) Parameter]
"No characters sent for 1 millisecond [AT (Guard Time After) Parameter]

All of the values in this sequence can be adjusted. AT Command is used to adjust the period of silence that precedes the command sequence character.

Parameter Range: 0 - 0xFFFF (x 1 millisecond)

# of bytes returned: 2

Default Parameter Value: 0x1F4 (500 decimal)

Related Commands: AT (Guard Time After), CC (Commands Sequence Character)

CC (Command Sequence Character) Parameter

<Non-AT Settable Parameter: AT Command Options> CC Parameter is used to adjust the command sequence character used when entering AT Command Mode.

The AT Command Mode Sequence used to enter AT Command Mode is as follows:

"No characters sent for 1 millisecond [BT (Guard Time Before) Parameter]
"Send three plus characters "+++" [CC (Command Sequence Character) Parameter]
"No characters sent for 1 millisecond [AT (Guard Time After) Parameter]

Parameter Range: 0x20 - 0x7F

# of bytes returned: 1

Default Parameter Value: 0x2B (ASCII "+" sign)

Related Parameters: AT (Guard Time After), BT (Guard Time Before)

CD (DO3 Configuration) Command

<AT Command: Serial Interfacing> Used to redefine the RX LED I/O line.

AT Command: ATCD

Parameter Ranges: 0 – 2

Parameter	Configuration
0	RX LED
1	High
2	Low

Default Parameter Value: 0

Number of bytes returned: 1

CN (Exit AT Command Mode) Command

<AT Command: AT Command Mode Options> CN Command allows users to explicitly exit AT Command Mode and return the radio modem into Idle Mode.

AT Command: CN

CS (DO2 Configuration) Command

<AT Command: Serial Interfacing> CS Command is used to modify the behavior of the $\overline{CTS}$ signal such that it either provides RS-232 flow control, enables RS-485 transmission / reception or determines RS-422 transmit enable. By default, $\overline{CTS}$ provides RS-232 flow control. CS Parameter must be adjusted for the modem to operate in RS-485/422 environments.

AT Command: ATCS

Parameter Ranges: 0 – 4

Parameter	Configuration
0	Normal CTS
1	RS-485 enable (low)
2	high
3	RS-485 enable (high)
4	low

Default Parameter Value: 0

Number of bytes returned: 1

CT (Time before Exit AT Command Mode) Parameter

<Non-AT Settable Parameter: AT Command Options> AT Command Mode can be exited manually using CN (Exit AT Command Mode) Command or, after a given time of inactivity, the modem exits AT Command Mode on its own and return to Idle Mode. CT Command sets the amount of time before AT Command Mode is exited automatically. If no characters are received before this time elapses, the modem will return to Idle Mode.

Parameter Range: 0x02 - 0xFFFF [x 100 ms]

# of bytes returned: 2

Default Parameter Value: 0xC8 (200d (20 decimal seconds))

DB (Receive Signal Strength) Command

<AT Command: Diagnostic> DB Parameter returns the receive signal strength (in decibels) of the last received packet. This Parameter is useful in determining range characteristics of the XCite Modules under various conditions.

AT Command: DB

Parameter Range: 0x25 - 0x6A [Read-only]

# of bytes returned: 1

DT (Destination Address) Command

<AT Command: Networking> DT Command is used to set the address of the XCite Radio Modem. XCite Radio Modems use three network layers - the Vendor Identification Number (ATID), Channels (ATHP) and Destination Addresses (ATDT).

DT Command assigns an address to a radio modem that enables it to communicate only with radio modems that have matching addresses. This is similar to interconnecting several PCs under a common hub. All radio modems that share the same destination address can communicate freely with each other. Radio Modems in the same network with a different destination address (than that of the transmitter) will listen to all transmissions to stay synchronized, but will not send any of the data out their serial ports.

AT Command: DT

Parameter Range: 0 - 0xFFFF

# of bytes returned: 2

Default Parameter Value: 0

Related Commands: ID (Modem ID), HP (Channel), MK (Address Mask)
