

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

XC6221 Series

ETR0328_015

Low ESR Caps Compatible High Speed LDO Voltage Regulator with ON/OFF Switch

■ GENERAL DESCRIPTION

The XC6221 series is a high accuracy, low noise, high speed, low dropout CMOS regulator with high ripple rejection. The series includes a reference voltage source, an error amplifier, a current limiter, and a phase compensation circuit.

The CE function enables the entire circuit to be in stand-by state by inputting low level signal. As for the XC6221B/D stand-by mode, the electric charge at the output capacitor (C_L) will be discharged by the internal auto-discharge switch, and as a result the V_{OUT} pin quickly returns to the V_{SS} level. The output stabilization capacitor (C_L) is also compatible with low ESR ceramic capacitors.

Output voltage is selectable in 0.05V increments within a range of 0.80V~5.00V, using the laser trimming technology set in factory.

The current limiter's fold-back circuit also operates as a short circuit protection and an output current limiter at the output pin. The series achieves a fast response with only 25 μ A of low power consumption. Also the series has low dropout voltage characteristics, which is 80mV at $I_{OUT}=100mA$ and $V_{OUT}=3.0V$.

With the use of small USP-4 and ultra small USPN-4 packages, a small footprint circuit can be designed.

■ APPLICATIONS

- Smart phones / Mobile phones
- Portable game consoles
- Digital still cameras / Camcorders
- Digital audio equipments
- Mobile devices / terminals

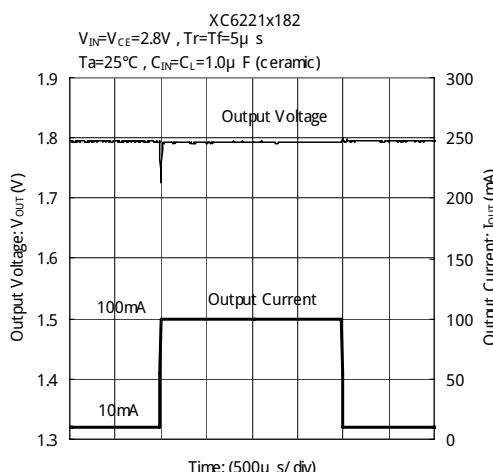

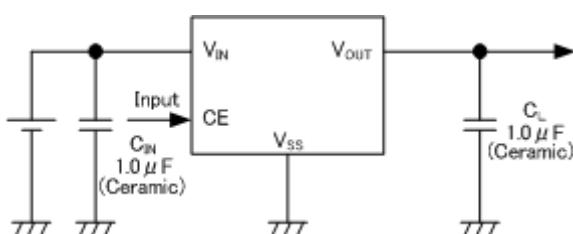

■ FEATURES

Maximum Output Current	: 200mA <Up to 250mA (TYP.)>
Dropout Voltage	: 80mV@ $I_{OUT}=100mA, V_{OUT}=3.0V$
Operating Voltage Range	: 1.6V ~ 6.0V
Output Voltage Range	: 0.80V~5.00V (0.05V increments)
Accuracy	: $\pm 2\%$ ($V_{OUT} \geq 1.50V$) (Standard) : $\pm 30mV$ ($V_{OUT} \leq 1.45V$) (Standard) : $\pm 1\%$ ($V_{OUT} \geq 2.00V$) (High Accuracy) : $\pm 20mV$ ($V_{OUT} \leq 1.95V$) (High Accuracy)
Low Power Consumption	: 25 μ A (TYP.)
Stand-by Current	: Less than 0.1 μ A
High Ripple Rejection	: 70dB @ 1kHz
CE Function	: CE Active High Standby current below 0.1 μ A C_L High-Speed Auto-Discharge (XC6221B/D) CE Pin internally pulled-down (XC6221C/D)
Low ESR Capacitor	: 1.0 μ F ceramic capacitor
Low Output Noise	
Operating Ambient Temperature	: -40°C~+85°C
Packages	: USP-4, SOT-25, SSOT-24 USPN-4
Environmentally Friendly	: EU RoHS Compliant, Pb Free

■ PIN CONFIGURATION

*It is recommended that the heat dissipation pad of the USP-4 package is soldered by using the reference mount pattern and metal mask pattern for mounting strength. The mount pattern should be electrically opened or connected to the V_{ss} (No.2) pin.

NOTE:

- * 1: Unless otherwise stated regarding input voltage conditions, $V_{IN}=V_{OUT(T)} + 1.0V$.
- * 2: $V_{OUT(E)}$ = Effective output voltage
(The output voltage when an amplly stabilized " $V_{OUT(T)} + 1.0V$ " is provided at the V_{IN} pin while maintaining a certain I_{OUT} value.)
- * 3: The relation between $V_{OUT(E)}$ and $V_{OUT(T)}$ is shown in the voltage chart E-0 and E-1.
- * 4: $V_{OUT(T)}$ = Nominal output voltage
- * 5: $V_{dif} = \{V_{IN1}^{(*)7} - V_{OUT1}^{(*)6}\}$
- * 6: V_{OUT1} is the voltage equal to 98% of the normal output voltage when amplly stabilized $V_{OUT(T)} + 1.0V$ are input at the V_{IN} pin.
- * 7: V_{IN1} is the input voltage when V_{OUT1} appears at the V_{OUT} pin while input voltage is gradually decreased.
- * 8: For the XC6221B/D series only. The XC6221A/C series discharges by resistors R1 and R2 only as shown in the block diagrams.
- * 9: For operating supply current of the XC6221C/D, a current through the pull-down resistor should be considered in addition to the supply current value mentioned above.

■ OPERATIONAL EXPLANATION

<Output Voltage Control>

The voltage divided by resistors R1 & R2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET connected to the V_{OUT} pin, is then driven by the subsequent output signal. The output voltage at the V_{OUT} pin is controlled & stabilized by a system of negative feedback. The current limit circuit and short protect circuit operate in relation to the level of output current. Further, the IC's internal circuitry can be shutdown via the CE pin's signal.

<Input and Output Capacitors>

The XC6221 needs an output capacitor C_L for phase compensation. Values required for the phase compensation are shown in the chart below. If a loss of the capacitance happens, the stable phase compensation may not be obtained. Please ensure to use a capacitor which does not depend on bias or temperature too much. For a stable power input, please connect an input capacitor C_{IN} of 1.0μ F between the V_{IN} pin and the V_{SS} pin.

- Except USPN-4

OUTPUT VOLTAGE (V)	OUTPUT CAPACITOR VALUE
0.80V ~ 1.15V	C _L ≥ 4.7μ F
1.20V ~ 1.35V	C _L ≥ 2.2μ F
1.40V ~ 4.00V	C _L ≥ 1.0μ F
4.05V ~ 5.00V	C _L ≥ 2.2μ F

<C_L Auto-Discharge Function>

XC6221B/D series can discharge the electric charge in the output capacitor (C_L), when a low signal to the CE pin, which enables the whole IC circuit to be turned off, is inputted via the N-channel transistor and C_L auto-discharge resistance (R_{DCHG}) located between the V_{OUT} pin and the V_{SS} pin (cf. BLOCK DIAGRAM). The C_L auto-discharge resistance (R_{DCHG}) value is set at 780Ω (V_{OUT}=4.0V @ V_{IN}=6.0V at typical). The discharge time of the output capacitor (C_L) is set by the C_L auto-discharge resistance (R_{DCHG}) and the output capacitor value (C_L). By setting the time constant of the C_L auto-discharge resistance value [R_{DCHG}] and the output capacitor value (C_L) as τ ($\tau = C_L \times R_{DCHG}$), the output voltage after discharge via the N-channel transistor is calculated by the following formula.

$$V = V_{OUT(E)} \times e^{-t/\tau}, \text{ or } t = \tau \ln(V / V_{OUT(E)})$$

where

V : Output voltage after discharge

V_{OUT(E)} : Output voltage

t : Discharge time

τ : C_L auto-discharge resistance R_{DCHG} × Output capacitor value C_L

■ OPERATIONAL EXPLANATION (Continued)

<Current Limiter, Short-Circuit Protection>

The XC6221 series' fold-back circuit operates as an output current limiter and a short protection circuit for the output pin. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. When the output pin is short-circuited to the V_{SS} pin, the current falls and reaches about 30mA.

<CE Pin>

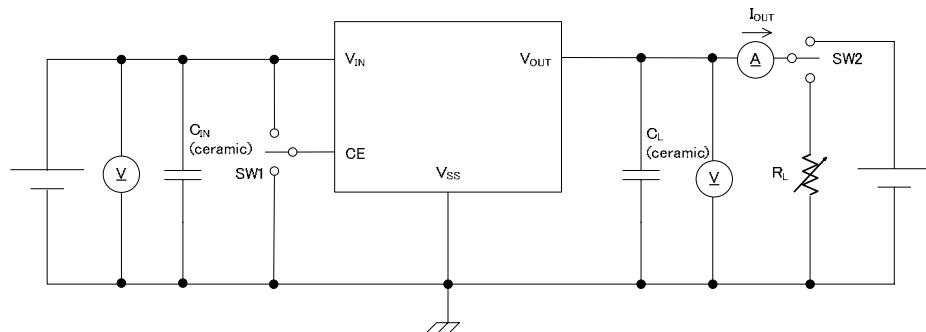

The XC6221 internal circuitry can be shutdown via the CE pin signal. In shutdown mode, output at the V_{OUT} pin will be pulled down to the V_{SS} level via R1 & R2. However, with the XC6221B/D series, the C_L auto-discharge resistor is connected in parallel to R1 and R2 while the power supply is applied to the V_{IN} pin. Therefore, time until the V_{OUT} pin reaches the V_{SS} level is shorter. For the XC6221A/B, the output voltage becomes unstable, when the CE pin is left open. For the XC6221C/D, the output voltage becomes V_{SS} level because the CE pin is short-circuited to V_{SS} via an internal pull-down resistor. However, the CE input current will be increased via a pull-down resistor when the IC operates. If this IC is used with the correct output voltage for the CE pin, the logic is fixed and the IC will operate normally. However, the supply current may increase as a result of shoot-through current in the IC's internal circuitry when a medium voltage is input.

■ NOTES ON USE

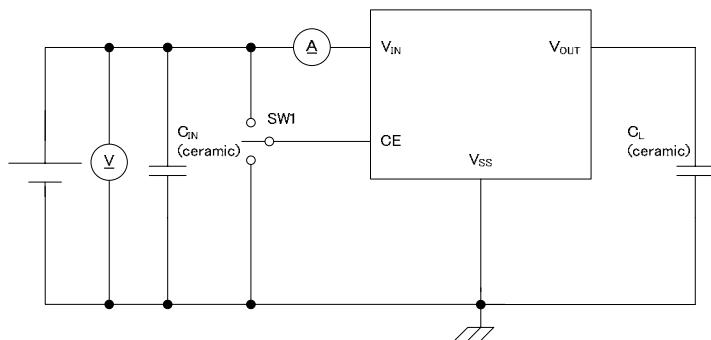

1. Please use this IC within the stated maximum ratings. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.
3. Torex places an importance on improving our products and its reliability.
However, by any possibility, we would request user fail-safe design and post-aging treatment on system or equipment.
