

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Ultra Low Power Synchronous Step-Down PFM DC/DC Converter

☆GreenOperation Compatible

### ■ GENERAL DESCRIPTION

XC9265 series are Ultra Low Power synchronous-rectification type PFM step down DC/DC converters with a built-in  $0.4\Omega$  (TYP.) Pch driver and  $0.4\Omega$  (TYP.) Nch synchronous switching transistor, designed to allow the use of ceramic capacitor.

PFM control enables a low quiescent current, making these products ideal for battery operated devices that require high efficiency and long battery life.

Only inductor,  $C_{IN}$  and  $C_L$  capacitors are needed as external parts to make a step down DC/DC circuit.

Operation voltage range is from 2.0V to 6.0V. This product has fixed output voltage from 1.0V to 4.0V(accuracy:  $\pm 2.0\%$ ) in increments of 0.05V.

During stand-by, all circuits are shutdown to reduce consumption to as low as  $0.1\mu A$ (TYP.) or less.

With the built-in UVLO (Under Voltage Lock Out) function, the internal P-channel MOS driver transistor is forced OFF when input voltage gets lower than UVLO detection voltage. Besides, XC9265 series has UVLO release voltage of 1.8V (Typ.).

The product with  $C_L$  discharge function can discharge  $C_L$  capacitor during stand-by mode due to the internal resistance by turning on the internal switch between  $V_{OUT}$ -GND. This enables output voltage restored to GND level fast.

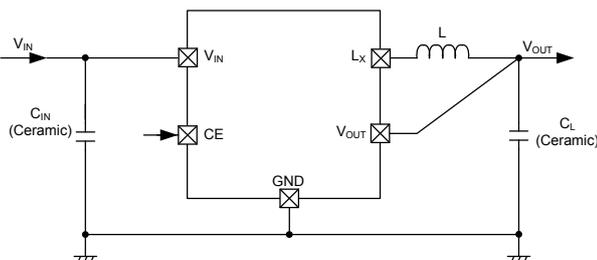

### ■ APPLICATIONS

- Wearable Devices
- Smart meters
- Bluetooth units
- Energy Harvest devices
- Back up power supply circuits
- Portable game consoles
- Devices with 1 Lithium cell

### ■ FEATURES

Input Voltage Range	:	2.0V~6.0V
Output Voltage Setting	:	1.0V~4.0V ( $\pm 2.0\%$ , 0.05V step increments)
Output Current	:	200mA(XC9265A/C) 50mA(XC9265B/D)
Driver Transistor	:	0.4 $\Omega$ (Pch Driver Tr) 0.4 $\Omega$ (Nch Synchronous rectifier Switch Tr)
Supply Current	:	0.50 $\mu A$ @ $V_{OUT(T)}=1.8V$ (TYP.)
Control Method	:	PFM control
High Speed Transient	:	50mV ( $V_{IN}=3.6V$ , $V_{OUT}=1.8V$ , $I_{OUT}=10\mu A \rightarrow 50mA$ )
PFM Switching Current	:	330mA(XC9265A/C), 180mA(XC9265B/D)
Function	:	Short Protection $C_L$ Discharge(XC9265C/ D) UVLO Ceramic Capacitor Compatible
Operation Ambient Temperature	:	-40~+85 $^{\circ}C$
Package	:	SOT-25, USP-6EL
Environmentally Friendly	:	EU RoHS compliant, Pb Free

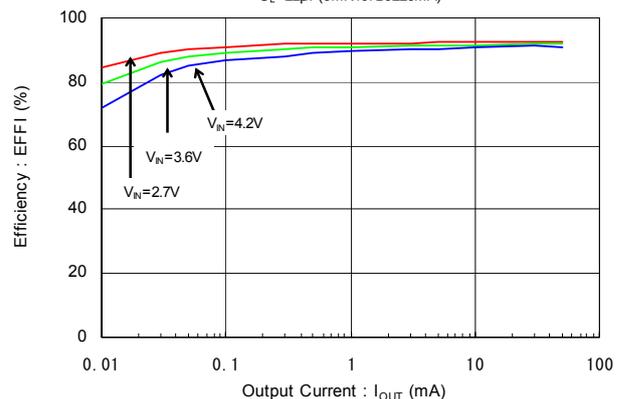

### ■ TYPICAL APPLICATION CIRCUIT

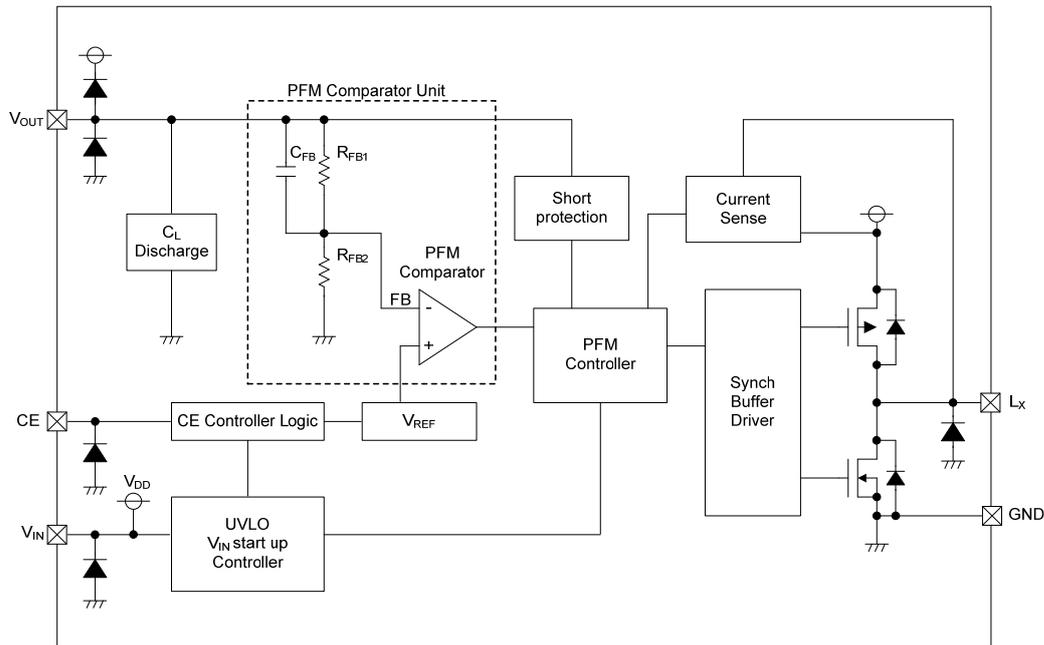

### ■ TYPICAL PERFORMANCE CHARACTERISTICS

#### ● Efficiency vs. Output Current XC9265B181xR-G( $V_{OUT}=1.8V$ )

$L=10\mu H$ (VLF302512M-100M),  $C_{IN}=10\mu F$ (LMK107BJ106MA),  
 $C_L=22\mu F$ (JMK107BJ226MA)

## ■ BLOCK DIAGRAM

\* Diodes inside the circuits are ESD protection diodes and parasitic diodes.  
XC9265A and B type do not have  $C_L$  Discharge function.

## ■ PRODUCT CLASSIFICATION

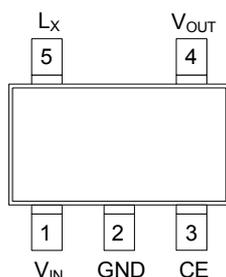

### ● Ordering information

XC9265①②③④⑤⑥-⑦

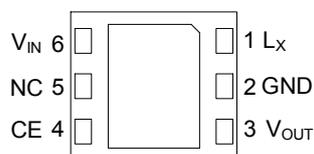

DESIGNATOR	ITEM	SYMBOL	DESCRIPTION
①	Product Type	A	$I_{out}=200\text{mA}$ Without $C_L$ Discharge
		B	$I_{out}=50\text{mA}$ Without $C_L$ Discharge
		C	$I_{out}=200\text{mA}$ With $C_L$ Discharge
		D	$I_{out}=50\text{mA}$ With $C_L$ Discharge
②③	Output Voltage	10 ~ 40	Output Voltage : e.g. $V_{OUT}=1.80\text{V} \Rightarrow$ ②=1, ③=8 Output Voltage Range: 1.0V~4.0V (0.05V step)
④	Output Voltage Type	1	Output Voltage {x.x0V} (the 2nd decimal place is "0")
		B	Output Voltage {x.x5V} (the 2nd decimal place is "5")
⑤⑥-⑦ <sup>(*)</sup>	Packages (Order Unit)	4R-G	USP-6EL (3,000pcs/Reel)
		MR-G	SOT-25 (3,000pcs/Reel)

<sup>(\*)</sup> The "-G" suffix denotes Halogen and Antimony free as well as being fully EU RoHS compliant.

## PIN CONFIGURATION

SOT-25  
(TOP VIEW)

USP-6EL  
(BOTTOM VIEW)

\* The dissipation pad for the USP-6EL package should be solder-plated in recommended mount pattern and metal masking so as to enhance mounting strength and heat release.

The mount pattern should be connected to GND pin (No.2).

## PIN ASSIGNMENT

PIN NUMBER		PIN NAME	FUNCTIONS
USP-6EL	SOT-25		
1	5	L <sub>X</sub>	Switching
2	2	GND	Ground
3	4	V <sub>OUT</sub>	Output Voltage
4	3	CE	Chip Enable
5	-	NC	No Connection
6	1	V <sub>IN</sub>	Power Input

## CE PIN FUNCTION

PIN NAME	SIGNAL	STATUS
CE	H	Operation (All Series)
	L	Standby (All Series)

\* Please do not leave the CE pin open.

## ABSOLUTE MAXIMUM RATINGS

T<sub>a</sub>=25°C

PARAMETER	SYMBOL	RATINGS	UNITS
V <sub>IN</sub> Pin Voltage	V <sub>N</sub>	-0.3 ~ +7.0	V
L <sub>X</sub> Pin Voltage	V <sub>LX</sub>	-0.3 ~ V <sub>IN</sub> +0.3 or +7.0 <sup>(*)</sup>	V
V <sub>OUT</sub> Pin Voltage	V <sub>OUT</sub>	-0.3 ~ V <sub>IN</sub> +0.3 or +7.0 <sup>(*)</sup>	V
CE Pin Voltage	V <sub>CE</sub>	-0.3 ~ +7.0	V
L <sub>X</sub> Pin Current	I <sub>LX</sub>	1000	mA
Power Dissipation	SOT-25	250	mW
	USP-6EL	120	
Operating Ambient Temperature	T <sub>opr</sub>	-40 ~ +85	°C
Storage Temperature	T <sub>stg</sub>	-55 ~ +125	°C

\* All voltages are described based on the GND.

<sup>(\*)</sup> The maximum value is the lower of either V<sub>IN</sub> + 0.3 or +7.0.

## ELECTRICAL CHARACTERISTICS

Efficiency <sup>(4)</sup>	EFFI	V <sub>IN</sub> =V <sub>CE</sub> =3.6V, V <sub>OUT(T)</sub> =1.8V <sup>(*)</sup> , I <sub>OUT</sub> =30mA.	-	87	-	%	①
L <sub>X</sub> SW "Pch" ON Resistance <sup>(5)</sup>	R <sub>LXP</sub>	V <sub>IN</sub> =V <sub>CE</sub> =5.0V, V <sub>OUT</sub> =0V, I <sub>LX</sub> =100mA.	-	0.4	0.65	Ω	④
L <sub>X</sub> SW "Nch" ON Resistance	R <sub>LXN</sub>	V <sub>IN</sub> =V <sub>CE</sub> =5.0V.	-	0.4 <sup>(6)</sup>	-	Ω	-
Output Voltage Temperature Characteristics	$\frac{\Delta V_{OUT}}{V_{OUT} \cdot \Delta T_{opr}}$	-40°C ≤ Topr ≤ 85°C.	-	±100	-	ppm/°C	②
CE "High" Voltage	V <sub>CEH</sub>	V <sub>OUT</sub> =0V. Resistor connected with L <sub>X</sub> pin. Voltage which L <sub>X</sub> pin changes "L" to "H" level while V <sub>CE</sub> =0.2→1.5V.	1.2	-	6.0	V	⑤
CE "Low" Voltage	V <sub>CEL</sub>	V <sub>OUT</sub> =0V. Resistor connected with L <sub>X</sub> pin. Voltage which L <sub>X</sub> pin changes "H" to "L" level while V <sub>CE</sub> =1.5→0.2V.	GND	-	0.3	V	⑤
CE "High" Current	I <sub>CEH</sub>	V <sub>IN</sub> =V <sub>CE</sub> =5.0V, V <sub>OUT</sub> =0V, L <sub>X</sub> =Open.	-0.1	-	0.1	μA	⑤
CE "Low" Current	I <sub>CEL</sub>	V <sub>IN</sub> =5.0V, V <sub>CE</sub> =V <sub>OUT</sub> =0V, L <sub>X</sub> =Open.	-0.1	-	0.1	μA	⑤
Short Protection Threshold Voltage	V <sub>SHORT</sub>	Resistor connected with L <sub>X</sub> pin. Voltage which L <sub>X</sub> pin changes "H" to "L" level while V <sub>OUT</sub> =V <sub>OUT(T)</sub> +0.1V→0V <sup>(*)</sup> .	0.4	0.5	0.6	V	②

Unless otherwise stated, V<sub>IN</sub>=V<sub>CE</sub>=5.0V

(\*) V<sub>OUT(T)</sub>=Nominal Output Voltage

(2) V<sub>OUT(E)</sub>=Effective Output Voltage

The actual output voltage value V<sub>OUT(E)</sub> is the PFM comparator threshold voltage in the IC.

Therefore, the DC/DC circuit output voltage, including the peripheral components, is boosted by the ripple voltage average value.

Please refer to the characteristic example.

(3) Not applicable to the products with V<sub>OUT(T)</sub> < 2.15V since it is out of operational voltage range.

(4) EFFI=[{(Output Voltage)×(Output Current)} / {(Input Voltage)×(Input Current)}]×100

(5) L<sub>X</sub> SW "Pch" ON resistance = (V<sub>IN</sub> - V<sub>LX</sub> pin measurement voltage) / 100mA

(6) Designed value

Unless otherwise stated, V<sub>IN</sub>=V<sub>CE</sub>=5.0V

(1) V<sub>OUT(T)</sub>=Nominal Output Voltage

(2) V<sub>OUT(E)</sub>=Effective Output Voltage

The actual output voltage value V<sub>OUT(E)</sub> is the PFM comparator threshold voltage in the IC.

Therefore, the DC/DC circuit output voltage, including the peripheral components, is boosted by the ripple voltage average value.

Please refer to the characteristic example.

(3) Not applicable to the products with V<sub>OUT(T)</sub> < 2.15V since it is out of operational voltage range.

(4) EFFI=[{(Output Voltage)×(Output Current)} / {(Input Voltage)×(Input Current)}]×100

(5) L<sub>X</sub> SW "Pch" ON resistance = (V<sub>IN</sub> - V<sub>LX</sub> pin measurement voltage) / 100mA

(6) Designed value

## ■ TYPICAL APPLICATION CIRCUIT

### 【Typical Examples】

	MANUFACTURE	PRODUCT NUMBER	VALUE
L	TDK	VLF302512M-100M	10 $\mu$ H
	Coilcraft	LPS3015-103MRB	10 $\mu$ H
	TOKO	1239AS-H-100M	10 $\mu$ H
C <sub>IN</sub>	TAIYO YUDEN	LMK107BJ106MA	10 $\mu$ F/10V
C <sub>L</sub>	TAIYO YUDEN	JMK107BJ226MA	22 $\mu$ F/6.3V

\* Take capacitance loss, withstand voltage, and other conditions into consideration when selecting components.

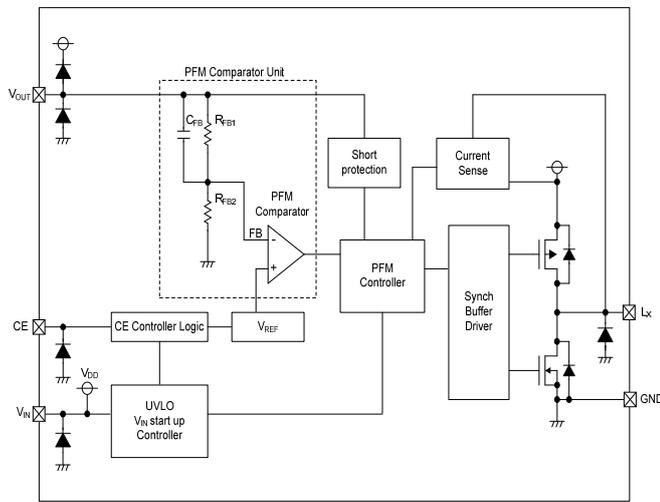

\* Characteristics are dependent on deviations in the coil inductance value. Test fully using the actual device.

\* A value of 10 $\mu$ H is recommended for the coil inductance.

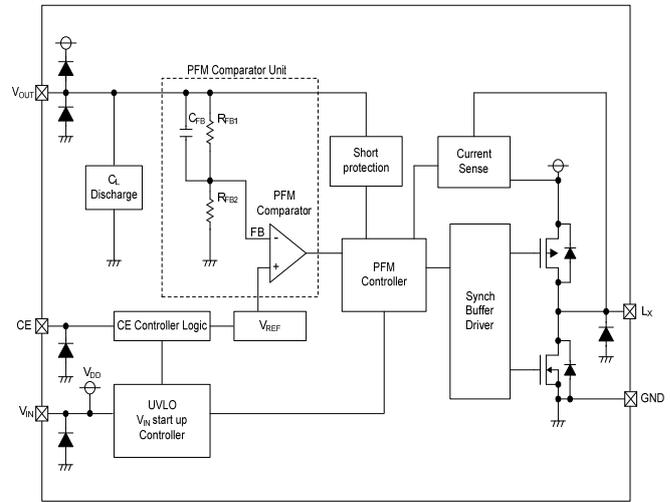

\* If a tantalum or electrolytic capacitor is used for the load capacitance C<sub>L</sub>, ripple voltage will increase, and there is a possibility that operation will become unstable. Test fully using the actual device.

## OPERATIONAL EXPLANATION

The XC9265 series consists of a reference voltage supply, PFM comparator, Pch driver Tr, Nch synchronous rectification switch Tr, current sensing circuit, PFM control circuit, CE control circuit, and others. (Refer to the block diagram below.)

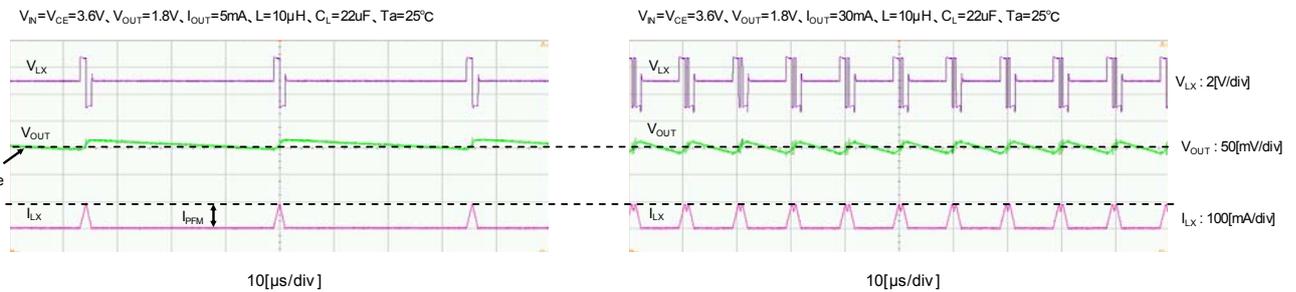

XC9265Axxx/XC9265Bxxx

XC9265Cxxx/XC9265xxx

An ultra-low quiescent current circuit and synchronous rectification enable a significant reduction of dissipation in the IC, and the IC operates with high efficiency at both light loads and heavy loads. Current limit PFM is used for the control method, and even when switching current superposition occurs, increases of output voltage ripple are suppressed, allowing use over a wide voltage and current range. The IC is compatible with low-capacitance ceramic capacitors, and a small, high-performance step-down DC-DC converter can be created.

The actual output voltage  $V_{OUT(E)}$  in the electrical characteristics is the threshold voltage of the PFM comparator in the block diagram. Therefore the average output voltage of the step-down circuit, including peripheral components, depends on the ripple voltage. Before use, test fully using the actual device.

### <Reference voltage supply ( $V_{REF}$ )>

Reference voltage for stabilization of the output voltage of the IC.

### <PFM control>

(1) The feedback voltage (FB voltage) is the voltage that results from dividing the output voltage with the IC internal dividing resistors  $R_{FB1}$  and  $R_{FB2}$ . The PFM comparator compares this FB voltage to  $V_{REF}$ . When the FB voltage is lower than  $V_{REF}$ , the PFM comparator sends a signal to the buffer driver through the PFM control circuit to turn on the Pch driver Tr. When the FB voltage is higher than  $V_{REF}$ , the PFM comparator sends a signal to prevent the Pch driver Tr from turning on.

(2) When the Pch driver Tr is on, the current sense circuit monitors the current that flows through the Pch driver Tr connected to the Lx pin. When the current reaches the set PFM switching current ( $I_{PFM}$ ), the current sense circuit sends a signal to the buffer driver through the PFM control circuit. This signal turns off the Pch driver Tr and turns on the Nch synchronous rectification switch Tr.

(3) The on time (off time) of the Nch synchronous rectification switch Tr is dynamically optimized inside the IC. After the off time elapses and the PFM comparator detects that the  $V_{OUT}$  voltage is higher than the set voltage, the PFM comparator sends a signal to the PFM control circuit that prevents the Pch driver Tr from turning on. However, if the  $V_{OUT}$  voltage is lower than the set voltage, the PFM comparator starts Pch driver Tr on.

## ■ OPERATIONAL EXPLANATION (Continued)

By continuously adjusting the interval of the linked operation of (1), (2) and (3) above in response to the load current, the output voltage is stabilized with high efficiency from light loads to heavy loads.

### <PFM Switching Current >

The PFM switching current monitors the current that flows through the Pch driver Tr, and is a value that limits the Pch driver Tr current.

The Pch driver Tr remains on until the coil current reaches the PFM switching current ( $I_{PFM}$ ). An approximate value for this on-time  $t_{ON}$  can be calculated using the following equation:

$$t_{ON} = L \times I_{PFM} / (V_{IN} - V_{OUT})$$

### <Maximum on-time function>

To avoid excessive ripple voltage in the event that the coil current does not reach the PFM switching current within a certain interval even though the Pch driver Tr has turned on and the FB voltage is above  $V_{REF}$ , the Pch driver Tr can be turned off at any timing using the maximum on-time function of the PFM control circuit. If the Pch driver Tr turns off by the maximum on-time function instead of the current sense circuit, the Nch synchronous rectification switch Tr will not turn on and the coil current will flow to the  $V_{OUT}$  pin by means of the parasite diode of the Nch synchronous rectification switch Tr.

### <Through mode>

When the  $V_{IN}$  voltage is lower than the output voltage, through mode automatically activates and the Pch driver Tr stays on continuously.

(1) In through mode, when the load current is increased and the current that flows through the Pch driver Tr reaches a load current that is several tens of mA lower than the set PFM switching current ( $I_{PFM}$ ), the current sense circuit sends a signal through the PFM control circuit to the buffer driver. This signal turns off the Pch driver Tr and turns on the Nch synchronous rectification switch Tr.

(2) After the on-time (off-time) of the Nch synchronous rectification switch Tr, the Pch driver Tr turns on until the current reaches the set PFM switching current ( $I_{PFM}$ ) again.

If the load current is large as described above, operations (1) and (2) above are repeated. If the load current is several tens of mA lower than the PFM switching current ( $I_{PFM}$ ), the Pch driver Tr stays on continuously.

### < $V_{IN}$ start mode>

When the  $V_{IN}$  voltage rises,  $V_{IN}$  start mode stops the short-circuit protection function during the interval until the FB voltage approaches  $V_{REF}$ . After the  $V_{IN}$  voltage rises and the FB voltage approaches  $V_{REF}$  by step-down operation,  $V_{IN}$  start mode is released. In order to prevent an excessive rush current while  $V_{IN}$  start mode is activated, the coil current flows to the  $V_{OUT}$  pin by means of the parasitic diode of the Nch synchronous rectification Tr. In  $V_{IN}$  start mode as well, the coil current is limited by the PFM switching current.

### <Short-circuit protection function>

The short-circuit protection function monitors the  $V_{OUT}$  voltage. In the event that the  $V_{OUT}$  pin is accidentally shorted to GND or an excessive load current causes the  $V_{OUT}$  voltage to drop below the set short-circuit protection voltage, the short-circuit protection function activates, and turns off and latches the Pch driver Tr at any selected timing. Once in the latched state, the IC is turned off and then restarted from the CE pin, or operation is started by re-applying the  $V_{IN}$  voltage.

### <UVLO function>

When the  $V_{IN}$  pin voltage drops below the UVLO detection voltage, the IC stops switching operation at any selected timing, turns off the Pch driver Tr and Nch synchronous rectification switch Tr (UVLO mode). When the  $V_{IN}$  pin voltage recovers and rises above the UVLO release voltage, the IC restarts operation.

### < $C_L$ discharge function>

On the XC9265 series, a  $C_L$  discharge function is available as an option (XC9265C/XC9265D types). This function enables quick discharging of the  $C_L$  load capacitance when "L" voltage is input into the CE pin by the Nch Tr connected between the  $V_{OUT}$ -GND pins, or in UVLO mode. This prevents malfunctioning of the application in the event that a charge remains on  $C_L$  when the IC is stopped. The discharge time is determined by  $C_L$  and the  $C_L$  discharge resistance  $R_{DCHG}$ , including the Nch Tr (refer to the diagram below). Using this time constant  $\tau = C_L \times R_{DCHG}$ , the discharge time of the output voltage is calculated by means of the equation below.

$$V = V_{OUT} \times e^{-t/\tau}, \text{ or in terms of } t, t = \tau \ln(V_{OUT} / V)$$

V: Output voltage after discharge

$V_{OUT}$ : Set output voltage

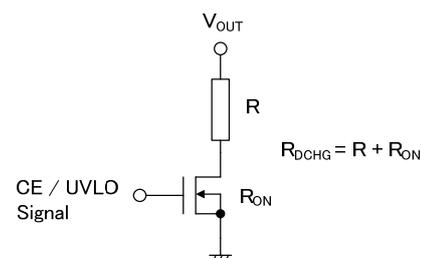

t: Discharge time

$C_L$ : Value of load capacitance ( $C_L$ )

$R_{DCHG}$ : Value of  $C_L$  discharge resistance Varies by power supply voltage.

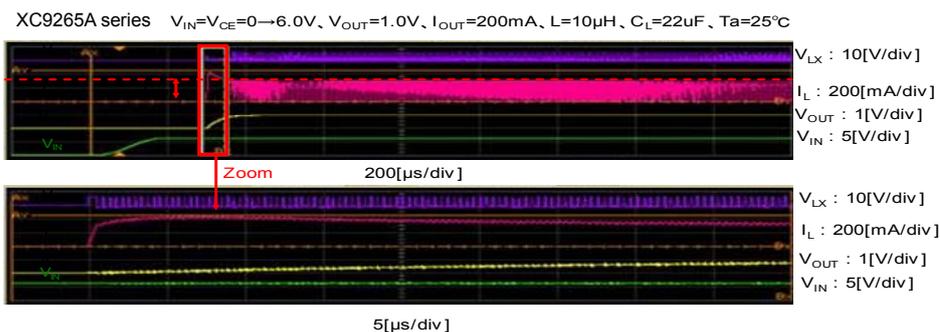

$$\tau : C_L \times R_{DCHG}$$

The  $C_L$  discharge function is not available on the XC9265A/XC9265B types.

## NOTE ON USE

1. Be careful not to exceed the absolute maximum ratings for externally connected components and this IC.
2. The DC/DC converter characteristics greatly depend not only on the characteristics of this IC but also on those of externally connected components, so refer to the specifications of each component and be careful when selecting the components. Be especially careful of the characteristics of the capacitor used for the load capacity  $C_L$  and use a capacitor with B characteristics (JIS Standard) or an X7R/X5R (EIA Standard) ceramic capacitor.
3. Use a ground wire of sufficient strength. Ground potential fluctuation caused by the ground current during switching could cause the IC operation to become unstable, so reinforce the area around the GND pin of the IC in particular.
4. Mount the externally connected components in the vicinity of the IC. Also use short, thick wires to reduce the wire impedance.
5. When the voltage difference between  $V_{IN}$  and  $V_{OUT}$  is small, switching energy increases and there is a possibility that the ripple voltage will be too large. Before use, test fully using the actual device.
6. The CE pin does not have an internal pull-up or pull-down, etc. Apply the prescribed voltage to the CE pin.
7. If other than the recommended inductance and capacitance values are used, excessive ripple voltage or a drop in efficiency may result.
8. If other than the recommended inductance and capacitance values are used, a drop in output voltage when the load is excessive may cause the short-circuit protection function to activate. Before use, test fully using the actual device.
9. At high temperature, excessive ripple voltage may occur and cause a drop in output voltage and efficiency. Before using at high temperature, test fully using the actual device.
10. At light loads or when IC operation is stopped, leakage current from the Pch driver  $I_r$  may cause the output voltage to rise.
11. The average output voltage may vary due to the effects of output voltage ripple caused by the load current. Before use, test fully using the actual device.
12. If the  $C_L$  capacitance or load current is large, the output voltage rise time will lengthen when the IC is started, and coil current overlay may occur during the interval until the output voltage reaches the set voltage (refer to the diagram below).

13. When the IC is started, the short-circuit protection function does not operate during the interval until the  $V_{OUT}$  voltage reaches a value near the set voltage.
14. If the IC is started at a  $V_{IN}$  voltage that activates through mode, it is possible that the short-circuit protection function will not operate. Before use, test fully using the actual device.
15. If the load current is excessively large when the IC is started, it is possible that the  $V_{OUT}$  voltage will not rise to the set voltage. Before use, test fully using the actual device.

## ■ NOTE ON USE (Continued)

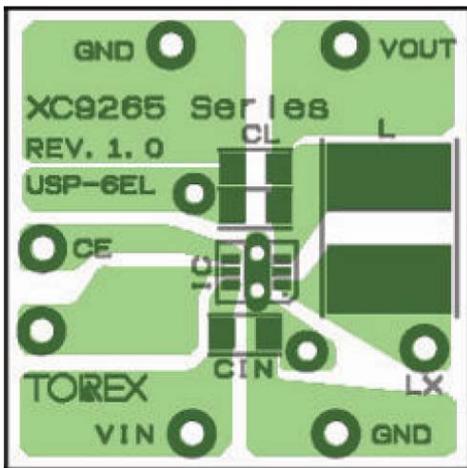

16. In actual operation, the maximum on-time depends on the peripheral components, input voltage, and load current. Before use, test fully using the actual device.
17. When the  $V_{IN}$  voltage is turned on and off continuously, excessive rush current may occur while the voltage is on. Before use, test fully using the actual device.
18. When the  $V_{IN}$  voltage is high, the Pch driver may change from on to off before the coil current reaches the PFM switching current ( $I_{PFM}$ ), or before the maximum on-time elapses. Before use, test fully using the actual device.
19. When the IC change to the Through Mode at light load, the supply current of this IC can increase in some cases.
20. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
21. Torex places an importance on improving our products and their reliability.  
We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
22. The UVLO function can be activated when the UVLO hysteresis width gets to about 0mV and after several tens ms elapses at light loads.  
Before use, test fully using the actual device.

## NOTE ON USE (Continued)

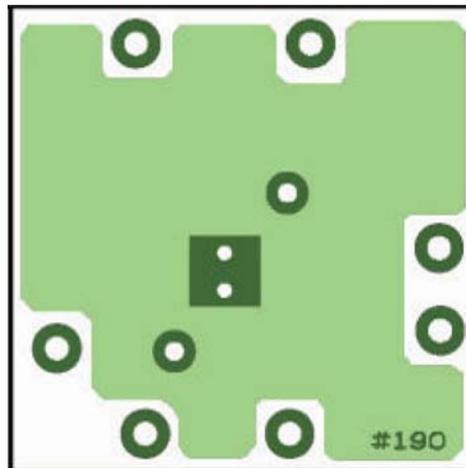

### ● Instructions of pattern layouts

1. To suppress fluctuations in the  $V_{IN}$  potential, connect a bypass capacitor ( $C_{IN}$ ) in the shortest path between the  $V_{IN}$  pin and ground pin.
2. Please mount each external component as close to the IC as possible.
3. Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
4. Make sure that the ground traces are as thick as possible, as variations in ground potential caused by high ground currents at the time of switching may result in instability of the IC.
5. Internal driver transistors bring on heat because of the transistor current and ON resistance of the driver transistors.
