

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# XR10910

## 16:1 Sensor Interface

### General Description

The XR10910 is a unique sensor interface integrated circuit with an on-board 16:1 multiplexer, offset correction DAC, instrumentation amplifier and voltage reference. The XR10910 is designed to integrate multiple bridge sensors with a microcontroller (MCU) or field-programmable gate array (FPGA).

The integrated offset correction DAC provides digital calibration of the variable and in many cases substantial offset voltage generated by the bridge sensors. The DAC is controlled by an I2C compatible 2 wire serial interface. The serial interface also provides the user with easy controls to the XR10910's many functions such as input and gain selection.

An integrated LDO provides a regulated voltage to power the input bridge sensors and is selectable, between 3V and 2.65V, via the serial interface for lower voltage compatibility. The LDO current can be sensed and a proportional voltage present at the output of the IC for monitoring the LDO current.

The XR10910 offers 8 fixed gain settings (from 2V/V to 760V/V), each with an error of only  $\pm 0.5\%$ , that are selectable via the I2C interface. It also offers less than 1mV maximum input offset voltage, 100pA maximum input bias current, and 100pA maximum input offset current.

The XR10910 is designed to operate from 2.7V to 5V supplies and is specified over the industrial temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . It is offered in a space saving 6mm x 6mm QFN-40 package. It consumes less than 556 $\mu\text{A}$  maximum supply current and offers a sleep mode for added power savings.

The low power, low input bias current and integrated features make the XR10910 well suited for both industrial and consumer applications using bridge sensors.

### FEATURES

- Integrated features for interfacing multiple bridge sensors with an MCU or FPGA:
  - 16:1 differential mux with I2C interface
  - Instrumentation amplifier
  - LDO
  - Offset correction DAC with I2C interface ( $\pm 560\text{mV}$  offset correction range - RTI)
- Eight selectable voltage gains from 2V/V to 760V/V with only  $\pm 0.5\%$  gain error
- 1mV maximum input offset voltage
- 100pA maximum input bias current
- 556 $\mu\text{A}$  maximum supply current
- 2.7V to 5V analog supply voltage range
- 1.8V to 5V digital supply voltage range
- $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  temperature range
- 6x6mm QFN-40

### APPLICATIONS

- Bridge sensor interface
- Pressure & temperature sensors
- Strain gauge amplifier
- Industrial process controls
- Weigh scales

Ordering Information - [back page](#)

### Typical Application

16:1 Bridge Sensor Interface

## Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Analog Supply Voltage ( $V_{CC}$ )	0V to 5.5V
Digital Supply Voltage ( $V_{DD}$ )	0V to 5.5V
Digital Input/Output ( $V_{DDIO}$ )	0V to 5.5V
$V_{IN}$	0 to $V_{CC}$
Differential Input Voltage (current limit of 10mA)	$V_{CC}$

## Operating Conditions

Analog Supply Voltage Range	2.7V to 5.25V
Digital Supply Voltage Range	1.7V to 5.25V
Operating Temperature Range	-40°C to 85°C
Junction Temperature	150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10s)	260°C

## Package Thermal Resistance

$\theta_{JA}$ (QFN-40)	32°C/W
------------------------	--------

Package thermal resistance ( $\theta_{JA}$ ), JEDEC standard, multi-layer test boards, still air.

## ESD Protection

QFN-40 (HBM)	4000V
--------------	-------

HBM - ESD Rating Human Body Model.

## Electrical Characteristics at +3.3V

$T_A = 25^\circ\text{C}$ ,  $V_{CC} = 3.3\text{V}$ ,  $V_{DD} = 1.8\text{V}$ ,  $R_L = 10\text{k}\Omega$  to  $1.5\text{V}$ ;  $G = 760$ ; unless otherwise noted.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
DC Performance						
$V_{IO}$	Input Offset Voltage	Input referred	-1	$\pm 0.02$	1	mV
$d_{VIO}$	Input Offset Voltage Average Drift			3		$\mu\text{V}/^\circ\text{C}$

## Register Information

Digital Part Control Register									
Reg No.		Name	Function	R/W/C	Byte of Parameter	Parameter	Default Code	Power-up Condition	Remark
Hex	Dec								
0x00	0	NOP	No operation	C	0		N/A		Does not execute a function. NOP is used to test successful I <sup>2</sup> C communication
Reset									
0x01	1	SW_RESET	Software reset	C	0		N/A		Resets all registers to default values
Read ID									
0x02	2	DEVICE_ID	Read Device ID	R	2	[15:0]: report "0910" in BCD	0x0910		Instructs the XR10910 to report its device ID "0910" in binary form (0000 1001 0001 0000)
0x03	3	VERSION_ID	Read HW & SW version numbers	R	2	[15:12]: reserved [11:8]: Hardware version # [7:0]: Software version #	N/A		Initial H/W version number is '0'; Initial S/W version number is '01'.
Sleep in/out									
0x04	4	SLEEP_OUT_REG	Normal operating mode, system active	C	0		N/A	Active	Puts the XR10910 into active mode. (wake up)
0x05	5	SLEEP_IN_REG	Sleep Mode	C	0		N/A	Active	Puts the analog portion of the XR10910 into sleep mode.  During sleep mode, the only I <sup>2</sup> C command that can be received/processed is the SLEEP_OUT command (0x04). All other register addresses will be ignored.
Basic Config									
0x06	6	Gain	Gain select	R/W	1	[2:0]: Gain select	0x00	Gain = 2	Eight gain settings are selectable (from 2V/V to 760V/V), refer to the Gain Register Table for more information.
0x07	7	LDO	LDO Settings	R/W	1	[0]:LDO 3V, 2.65V [1]:LDO disable	0x00	LDO = 3V	Bit 0 controls the LDO voltage (0:3V; 1:2.65V). Bit 1 (Sleep Mode only). Bit 1 controls whether the LDO shuts down or stays on during Sleep Mode. (0: Enable; 1: Disable). When the XR10910 is active, the LDO is always on.
0x08	8	LDO Current Sense Select	LDO Current Sense	C	0		N/A	Off	When on, the LDO current is sensed and a proportional voltage is present at the output of the XR10910.  Current Sense Mode remains active until an input select command is received by the XR10910.
Channel Switch (Input Mux Select)									
0x10	16	Select_Input_1	Select Channel 1	C	0		N/A	Channel 1 is selected	Select +IN1, -IN1; Channel 1
0x11	17	Select_Input_2	Select Channel 2	C	0				Select +IN2, -IN2; Channel 2
0x12	18	Select_Input_3	Select Channel 3	C	0				Select +IN3, -IN3; Channel 3
0x13	19	Select_Input_4	Select Channel 4	C	0				Select +IN4, -IN4; Channel 4
0x14	20	Select_Input_5	Select Channel 5	C	0				Select +IN5, -IN5; Channel 5
0x15	21	Select_Input_6	Select Channel 6	C	0				Select +IN6, -IN6; Channel 6
0x16	22	Select_Input_7	Select Channel 7	C	0				Select +IN7, -IN7; Channel 7
0x17	23	Select_Input_8	Select Channel 8	C	0				Select +IN8, -IN8; Channel 8
0x18	24	Select_Input_9	Select Channel 9	C	0				Select +IN9, -IN9; Channel 9
0x19	25	Select_Input_10	Select Channel 10	C	0				Select +IN10, -IN10; Channel 10
0x1A	26	Select_Input_11	Select Channel 11	C	0				Select +IN11, -IN11; Channel 11
0x1B	27	Select_Input_12	Select Channel 12	C	0				Select +IN12, -IN12; Channel 12
0x1C	28	Select_Input_13	Select Channel 13	C	0				Select +IN13, -IN13; Channel 13
0x1D	29	Select_Input_14	Select Channel 14	C	0				Select +IN14, -IN14; Channel 14
0x1E	30	Select_Input_15	Select Channel 15	C	0				Select +IN15, -IN15; Channel 15
0x1F	31	Select_Input_16	Select Channel 16	C	0				Select +IN16, -IN16; Channel 16

Note: Register Numbers not listed above have no function.

Set-up Time - from  $G = 2$  to  $G = 300$  (DUT Output)

LDO Enable to Disable Time

LDO Disable to Enable Time

## Application Information

### Functional Block Diagram

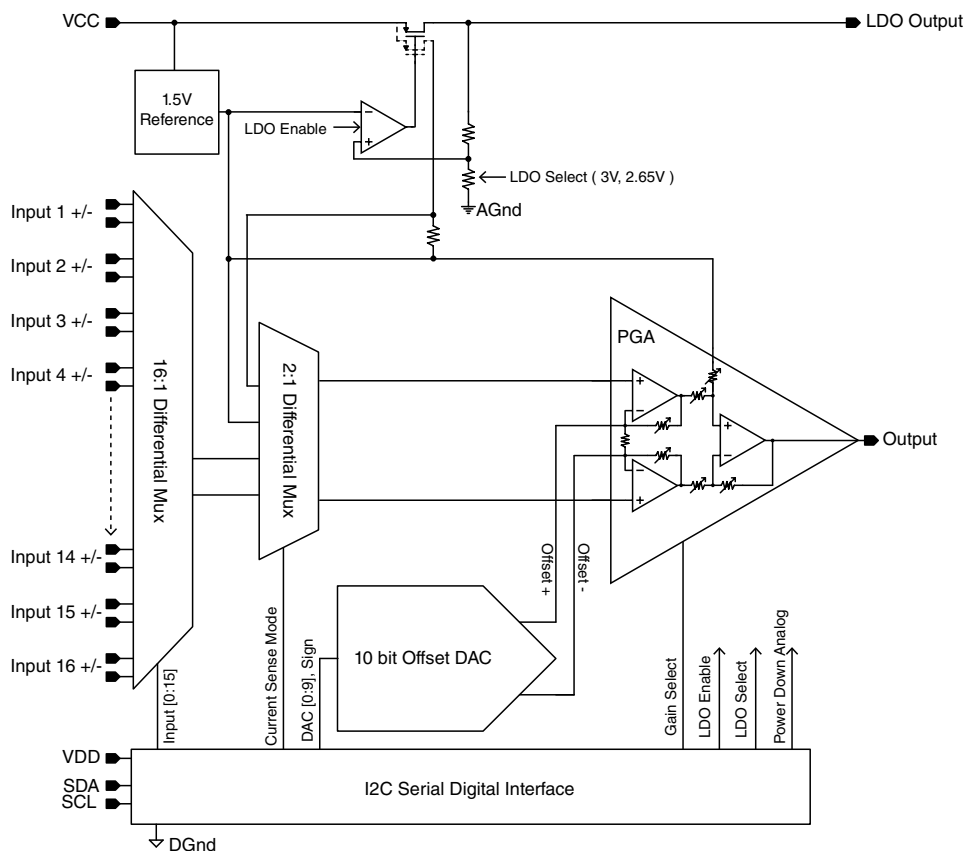

Figure 2: Functional Block Diagram

The XR10910 sensor interface includes a 16:1 differential multiplexor (mux), a programmable gain instrumentation amplifier, a 10-bit offset correction DAC and an LDO. An I<sup>2</sup>C interface controls the many functions and features of the XR10910. The XR10910 is designed to integrate multiple bridge sensors with an ADC/MCU or FPGA.

Each bridge sensor connected to the XR10910 has its own inherent offset that if not calibrated out can decrease sensitivity and overall performance of the sensor system. The on-board DAC introduces an offset into the instrumentation amplifier to calibrate the offset voltage generated by the sensors. An independent offset can be set for each of the 16 channels. Only the offset voltage of the active channel is applied to the PGA.

The programmable gain instrumentation amplifier offers 8 selectable gains from 2V/V to 760V/V to amplify the signal such that it falls within the input range of the ADC.

An integrated LDO provides a regulated voltage to power the input bridge sensors and is selectable, between 3V and 2.65V. The LDO can be set to turn off when the XR10910 is in Sleep Mode to save power.

The XR10910 also provides the ability to monitor the LDO

current. When the XR10910 is in Current Sense Mode, an internal 2:1 mux allows a voltage proportional to the LDO current to be present at the output. Once all channels have been calibrated, the LDO current can be used to indirectly monitor any voltage or resistive changes seen by the inputs.

The XR10910 also includes an internal 1.5V reference that is used by the internal LDO circuitry and used to set the reference voltage for the programmable gain instrumentation amplifier.

During sleep mode, the analog components of the XR10910 are powered down for added power savings.

The XR10910 offers many functions, each controlled by the I<sup>2</sup>C compatible serial interface:

- Input Selection
- Gain Selection
- Offset Correction
- LDO Enable / Select
- Current Sense Mode
- Sleep Mode (Analog Power Down)

Refer to the appropriate section below for additional information about each function.

### I<sup>2</sup>C Bus Interface

The I<sup>2</sup>C-bus interface consists of two lines: serial data (SDA) and serial clock (SCL). The XR10910 works as a slave and supports both standard mode transfer rates (100 kbps) and fast mode transfer rates (400 kbps) as defined in the I<sup>2</sup>C-Bus specification. The I<sup>2</sup>C-bus interface follows all standard I<sup>2</sup>C protocols. Some information is provided below, for additional information, refer to the I<sup>2</sup>C-bus specifications.

Figure 3: I<sup>2</sup>C Start and Stop Conditions

The basic I<sup>2</sup>C access cycle for the XR10910 consists of:

- A start condition
- A slave address cycle
- Zero, one, or two data cycles - depending on the XR10910 register accessed
- A stop condition

**Start Condition** - The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 3.

**Slave Address Cycle** – After the start condition, the first byte sent by the master is the 7-bit address and the read/write direction bit R/W on the SDA line. If the address matches the XR10910’s internal fixed address, the XR10910 will respond with an acknowledge by pulling the SDA line low for one clock cycle while SCL is high.

**Data Cycle** – After the master detects this acknowledge, the next byte transmitted by the master is the sub-address. This 8-bit sub-address contains the address of the register to access. The XR10910 Register List is shown in Table 1. Depending on the register accessed, there will be up to two additional data bytes transmitted by the master. Refer to the “Byte of Parameter” column in the Register Table. The XR10910 will respond to each write with an acknowledge.

**Stop Condition** – To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high, as shown in Figure 3.

Figures 4 and 5 illustrate a write and a read cycle. For complete details, see the I2C-bus specifications.

Figure 5: Master Reads from Slave (XR10910)

### I<sup>2</sup>C Bus Addressing

The XR10910 uses a 7-bit address space. For the standard XR10910, the default address is 0x67 (0110 111).

I2C Address	Orderable Part#
0x67 (0110 111 <del>x</del> )	XR10910IL40TR-F

Table 4: XR10910 I<sup>2</sup>C Address Map

A read or write transaction is determined by bit-0 of the slave address, (shown as an “x” in Table 1 above). If bit-0 is ‘0’, then it is a write transaction. If bit-0 is ‘1’, then it is a read transaction.

An I2C sub-address is sent by the I2C master following the slave address. The sub-address contains the XR10910 register address being accessed. Table 1 illustrates the available XR10910 register addresses.

After the last read or write transaction, the I2C-bus master will set the SCL signal back to its idle state (HIGH).

## Inputs and Input Selection

The XR10910 includes 16 differential inputs and a 16:1 differential mux that is controlled by an I<sup>2</sup>C compatible 2 wire serial interface. The XR10910 is designed to accept 16 differential inputs.

- If fewer than 16 differential inputs are required, tie the unused inputs to GND.
- If single ended inputs are required, tie the unused inputs to 1.5V.

The input common mode range of the XR10910 is typically 0.6V to 2.4V when running from a 3.3V supply. The XR10910 offers a very wide gain range. In most cases, the output voltage swing will be the limiting factor.

When the XR10910 is powered-up, the default input selected is Channel 1.

Inputs are selected via I<sup>2</sup>C using one of 16 register addresses 0x10 thru 0x1F. Refer to the Register List in Table 1.

Example: The example below illustrates how to select Channel 5.

Step 1	0
Master sends start condition	S

Step 2	7	6	5	4	3	2	1	0
Master sends XR10910 address with write bit	0	1	1	0	1	1	1	0
	6			7			W	
	7-bit XR10910 Address = 0x67							

Step 3	9
XR10910 sends acknowledge	A

Step 4	7	6	5	4	3	2	1	0
Master sends address of register to access	0	0	0	1	0	1	0	0
	Select_Input 5 register address = 0x14							

Step 5	9
XR10910 sends acknowledge	A

Step 6	0
Master sends stop condition	P

White Block = host to XR10910  
 Red Block = XR10910 to host  
 Grey Block = Notes

## Gain Selection

The XR10910 offers 8 selectable fixed gains ranging from 2V/V to 760V/V. When the XR10910 is powered-up, the default gain is 2V/V.

The gain is selected via I<sup>2</sup>C using the register address 0x06 followed by another byte of data to select the gain. Refer to the Register List in Table 1 and the Gain Register list in Table 3.

Example: The example below illustrates how to select a gain of 150V/V.

To start communication with the XR10910, repeat steps 1-3 as shown in the Inputs and Input Selection section on page 11.

Step 4	7	6	5	4	3	2	1	0
Master sends address of register to access	0	0	0	0	0	1	1	0
	Gain Select register address = 0x06							

Step 5	9
XR10910 sends acknowledge	A

Since the Gain Select register was accessed, the XR10910 is expecting another byte of data from the master to complete the command. Refer to the “Byte of Parameter” column in the Register List (Table 1). D0 thru D2 are used to select the gain. Refer to the Gain Register list in Table 3, 150V/V is D2 = 1, D1 = 0, and D0 = 0. This translates to a hex code of 0x04, since a full byte of data (8-bits) will be sent.

Step 6	7	6	5	4	3	2	1	0
Master sends gain register data to select G=150	0	0	0	0	0	1	0	0
	Gain of 150V/V = 0x04							

Step 7	9
XR10910 sends acknowledge	A

Step 8	0
Master sends stop condition	P

White Block = host to XR10910  
 Red Block = XR10910 to host  
 Grey Block = Notes

**Offset Correction**

The XR10910 has a 10-bit offset correction DAC that can be used to provide digital calibration on each of the 16 inputs. Only the offset voltage of the active channel is applied to the PGA.

The DAC offset of each channel is controlled by the I2C compatible interface. At any time, the master can read or write to any of the DAC offset registers. The DAC offset for each channel is set via I2C using the register addresses 0x20 thru 0x2F followed by another two bytes of data to set the polarity and value of the offset voltage. Refer to the Register List in Table 1.

A ±560mV offset correction range is available. The full range of the DAC offset is only available at a gain of 2. At higher gains, the output voltage range of the XR10910 will be exceeded if the full range of the DAC offset is used. The internal 10-bit DAC allows 1,024 different offset voltage settings between 0mV and 560mV. The polarity of the offset correction is set with an additional bit. The unit offset is determined by the following:

$$\text{Unit offset} = \frac{\text{Total Offset}}{\text{DAC output levels}} = \frac{560\text{mV}}{1024} = 547\mu\text{V}$$

From Table 3:

- 0x00 (hex) or 0 00 0000 0000 (binary) applies a 0mV offset
- 0x3FF (hex) or 0 11 1111 1111 (binary) applies a +560mV offset
- 0x7FF (hex) or 1 11 1111 1111 (binary) applies a -560mV offset

Each DAC output level provides an additional 547µV of offset. To determine what DAC output level corresponds to a specific desired offset, use the following equation:

$$x = \frac{\text{Desired Offset}}{\text{Unit Offset}}$$

See example below for additional information.

Example: The example below illustrates how to set the DAC offset for channel 7 to a value of 75mV.

To start communication with the XR10910, repeat steps 1-3 as shown in the Inputs and Input Selection section on page 11.

Step 4	7	6	5	4	3	2	1	0
Master sends address of register to access	0	0	1	0	0	1	1	0
DAC7 register address = 0x26								

Step 5	9
XR10910 sends acknowledge	A

Since a DAC Offset register was accessed, the XR10910 is expecting another two bytes of data from the master to complete the command. Refer to the “Byte of Parameter” column in the Register List (Table 1). D0 thru D9 are used to set the offset voltage and D10 is used to set the sign of the offset voltage, 0 = positive and 1 = negative. Refer to the DAC Offset register list in Table 2.

To determine what DAC output level corresponds to 75mV, use the following equation:

$$\text{DAC Output Level} = \frac{\text{Desired Offset}}{\text{Unit Offset}} = \frac{75\text{mV}}{547\mu\text{V}} = 137$$

A decimal value of 137 corresponds to 75mV. Therefore:

- 0x89 (hex) or 0 00 1000 1001 (binary) applies a +75mV offset
- 0x489 (hex) or 1 00 1000 1001 (binary) applies a -75mV offset

Step 6	15	14	13	12	11	10	9	8
Master sends 1 <sup>st</sup> byte of DAC offset register data to select an offset of +75mV	0	0	0	0	0	0	0	0
							Sign	2 MSBs of 10-bit DAC output level that corresponds to 137 (0x89)

Step 7	9
XR10910 sends acknowledge	A

Step 8	7	6	5	4	3	2	1	0
Master sends 2 <sup>nd</sup> byte of DAC offset register data to select an offset of +75mV	1	0	0	0	1	0	0	1
								8 LSBs of 10-bit DAC output level that corresponds to 137 (0x89)

Step 9	9
XR10910 sends acknowledge	A

Step 10	0
Master sends stop condition	P

White Block = host to XR10910  
 Red Block = XR10910 to host  
 Grey Block = Notes

## LDO Enable / Select (Power to External Bridge Sensors)

The XR10910 includes an on-board LDO that provides a regulated voltage that can be used to power external input bridge sensors. Two voltage options are available, 3V and 2.65V. The LDO voltage is selected via the I2C compatible two-wire serial interface.

When the XR10910 is powered-up, the default LDO voltage is 3V.

When the XR10910 is active (not in sleep mode), the LDO is always on. If the LDO voltage is not used, the LDO output can be left floating. The LDO can either stay on or shut down while the XR10910 is in Sleep Mode.

- Set LDO to shut down while XR10910 is in Sleep Mode to save power
- Set LDO to stay on while XR10910 is in Sleep Mode to improve wake-up time

The LDO voltage and disable setting are selected via I2C using the register address 0x07 followed by another byte of data to select the voltage and disable setting. Refer to the Register List in Table 1 and the example below for more information.

Example: The example below illustrates how to select an LDO voltage of 2.65V and keep the LDO enabled during Sleep Mode.

To start communication with the XR10910, repeat steps 1-3 as shown in the Inputs and Input Selection section on page 11.

Step 4	7	6	5	4	3	2	1	0
Master sends address of register to access	0	0	0	0	0	1	1	1
LDO Settings register address = 0x07								

Step 5	9
XR10910 sends acknowledge	A

Since the LDO Settings register was accessed, the XR10910 is expecting another byte of data from the master to complete the command. Refer to the "Byte of Parameter" column in the Register List (Table 1). D0 and D1 are used to select the LDO voltage and enable/disable the LDO during Sleep Mode. Bit 0 (D0) controls the LDO voltage (0: 3V; 1: 2.65V). Bit 1 (D1) is only applicable in Sleep Mode. Bit 1 controls whether the LDO shuts down or stays on during sleep mode (0: Enable; 1: Disable). When the XR0910 is active, the LDO is always on.

Step 6	7	6	5	4	3	2	1	0	
Master sends code to select LDO voltage of 2.65V and Enable LDO during Sleep Mode	0	0	0	0	0	0	0	0	
								0 = Enable	1 = 2.65V

Step 7	9
XR10910 sends acknowledge	A

Step 8	0
Master sends stop condition	P

White Block = host to XR10910

Red Block = XR10910 to host

Grey Block = Notes

## Current Sense Mode (Monitoring the LDO Current)

Current Sense Mode is activated via I2C using the register address 0x08. When activated, the LDO current is sensed and a proportional voltage is present at the output of the XR10910 ( $ILDO = VOUT/RL$ ). Current Sense Mode stays active until the XR10910 receives any input select command (0x10 thru 0x1F).

Current sense mode can be used to monitor the change over time of the bridge impedance.

## Sleep Mode (Analog Power Down)

Sleep Mode is activated via I<sup>2</sup>C using the register address 0x05. When activated, the XR10910 will enter Sleep Mode. During Sleep Mode, the analog portion of the XR10910 is disabled. All register settings are retained during Sleep Mode.

During Sleep Mode, the nominal supply current will drop below 70 $\mu$ A (with LDO on) and below 45 $\mu$ A (with LDO off).

During Sleep Mode, the master can read the value in any register that saves a value during sleep mode. The only I<sup>2</sup>C commands that can be received or processed is the SLEEP\_OUT (wake up) command (0x04) or the LDO on/off and voltage command (0x07). All other register addresses will be ignored.

Register address 0x04 is used to return to normal operation (exit Sleep Mode).

By default, the XR10910 is active.

## Typical Application – 16:1 Bridge Sensor Interface

The XR10910 was designed to interface multiple bridge sensors with a microcontroller or FPGA as illustrated in Figure 6.

The bridge output signal is differential ( $V_{o+}$  and  $V_{o-}$ ). Ideally, the unloaded bridge output is zero ( $V_{o+}$  and  $V_{o-}$  are identical). However, in-exact resistive values result in a difference between  $V_{o+}$  and  $V_{o-}$ . This bridge offset voltage can be substantial and vary between sensors. The XR10910 provides the ability to calibrate the bridge offset on each of the 16 bridge sensors using the on-board DAC.

Figure 6: 16:1 Bridge Sensor Interface

## Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Follow the steps below as a basis for high frequency layout:

- Include 6.8 $\mu$ F and 0.1 $\mu$ F ceramic capacitors for power supply decoupling
- Place the 6.8 $\mu$ F capacitor within 0.75 inches of the power pin
- Place the 0.1 $\mu$ F capacitor within 0.1 inches of the power pin
- Connection to the exposed pad is not required. Exposed pad can be connected to ground (GND).
- Minimize all trace lengths to reduce series inductances
