

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

The XR79115 is a 15A synchronous step-down Power Module for point-of-load supplies. A wide 5V to 22V input voltage range allows for single supply operation from industry standard 5V, 12V, and 19.6V rails.

With a proprietary emulated current mode Constant On-Time (COT) control scheme, the XR79115 provides extremely fast line and load transient response using ceramic output capacitors. It requires no loop compensation hence simplifying circuit implementation and reducing overall component count. The control loop also provides 0.35% load and 0.1% line regulation and maintains constant operating frequency. A selectable power saving mode allows the user to operate in discontinuous mode (DCM) at light current loads thereby significantly increasing the converter efficiency. With a 96% peak efficiency and 90% for loads as low as 100mA, the XR79115 is suitable for applications where low power losses are important.

A host of protection features, including over-current, over-temperature, short-circuit and UVLO, help achieve safe operation under abnormal operating conditions.

The XR79115 is available in a RoHS compliant, green/halogen free space-saving 68-pin 12x12x4mm QFN package. With integrated controller, drivers, bootstrap diode and capacitor, MOSFETs, inductor, CIN and COUT, this solution allows the smallest possible 15A POL design.

FEATURES

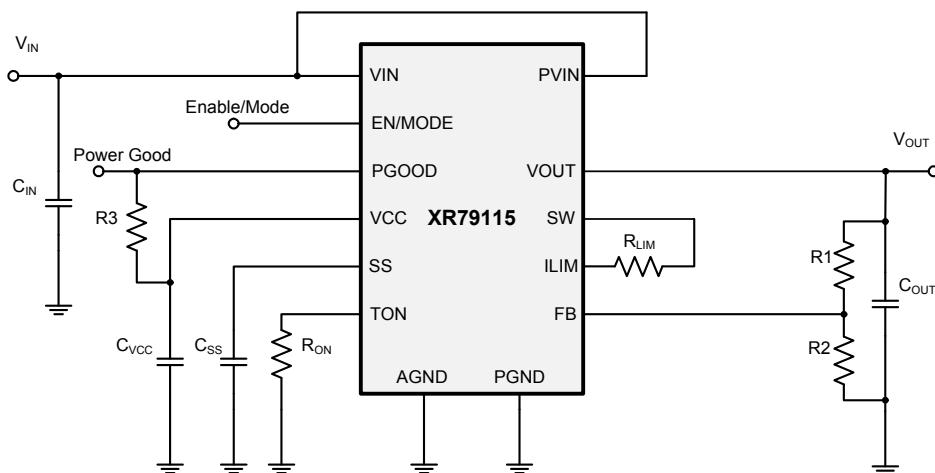

- Controller, drivers, bootstrap diode and capacitor, MOSFETs, Inductor, CIN and COUT integrated in one package
- 15A Step Down Module
 - Wide 5V to 22V Input Voltage Range
 - >0.6V Adjustable Output Voltage
- Proprietary Constant On-Time Control
 - No Loop Compensation Required
 - Stable Ceramic Output Capacitor Operation
 - Programmable 200ns to 2µs On-Time
 - Constant 400kHz to 600kHz Frequency
- Selectable CCM or CCM/DCM
 - CCM/DCM for high efficiency at light-load
 - CCM for constant frequency at light-load
- Programmable Hiccup Current Limit with Thermal Compensation
- Precision Enable and Power Good flag
- Programmable Soft-start
- 68-pin 12x12x4mm QFN package

APPLICATIONS

- Networking and Communications
- Fast Transient Point-of-Loads
- Industrial and Medical Equipment
- Embedded High Power FPGA

Typical Application

Line Regulation

Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

PV_{IN}, V_{IN}	-0.3V to 25V
V_{CC}	-0.3V to 6.0V
BST	-0.3V to 31V ¹
BST-SW	-0.3V to 6V
SW, ILIM	-1V to 25V ^{1,2}
ALL other pins	-0.3V to $V_{CC}+0.3V$
Storage Temperature	-65°C to +150°C
Junction Temperature	150°C
Power Dissipation	Internally Limited
Lead Temperature (Soldering, 10 sec)	260°C MSL3
ESD Rating (HBM - Human Body Model)	2kV

Operating Conditions

PV_{IN}	3V to 22V
V_{IN}	4.5V to 22V
V_{CC}	4.5V to 5.5V
SW, ILIM	-1V to 22V ¹
PGOOD, V_{CC} , T_{ON} , SS, EN, FB	-0.3V to 5.5V
Switching Frequency	400kHz to 600kHz ³
Junction Temperature Range	-40°C to +125°C
JEDEC51 Package Thermal Resistance, θ_{JA}	15.4°C/W
Package Power Dissipation at 25°C	6.5W

Note 1: No external voltage applied.

Note 2: SW pin's minimum DC range is -1V, transient is -5V for less than 50ns.

Note 3: Recommended frequency for optimum performance

Electrical Characteristics

Unless otherwise noted: $T_J = 25^\circ\text{C}$, $V_{IN} = 12\text{V}$, $BST = V_{CC}$, $SW = AGND = PGND = 0\text{V}$, $C_{VCC} = 4.7\mu\text{F}$. Limits applying over the full operating temperature range are denoted by a “•”

Pin Configuration, Top View

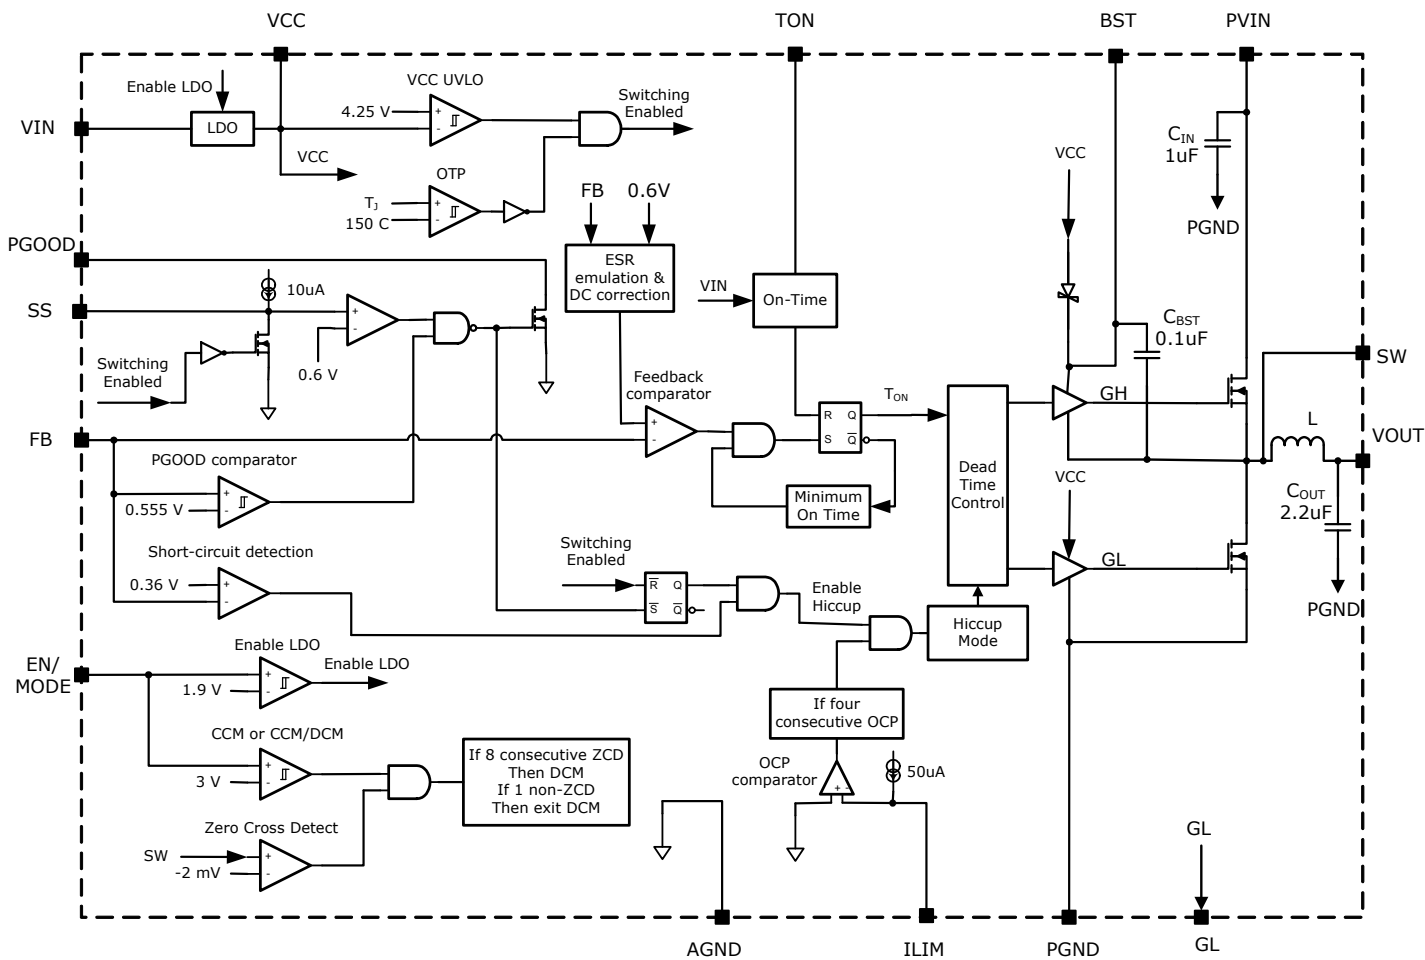

Pin Assignments

Pin No.	Pin Name	Type	Description
1	SS	A	Soft-start pin. Connect an external capacitor between SS and AGND to program the soft-start rate based on the 10uA internal source current.
2	PGOOD	OD, O	Power-good output. This open-drain output is pulled low when V_{OUT} is outside the regulation.
3	FB	A	Feedback input to feedback comparator. Connect with a set of resistors to VOUT and AGND in order to program VOUT.
4, 67, AGND Pad	AGND	A	Analog ground. Control circuitry of the IC is referenced to this pin.
5	VIN	PWR	IC supply input. Provides power to internal LDO.
6	VCC	PWR	The output of LDO. Bypass with a 4.7uF capacitor to AGND. For operation from a 5V _{IN} rail, VCC should be tied to VIN.
7, GL pad	GL	O	Driver output for Low-side N-channel synchronous MOSFET. It is internally connected to the gate of the FET. Leave this pin floating.
8	PGND	PWR	Controller low-side driver ground. Connect with a short trace to closest PGND pins or PGND pad.
13-23, 54, 55, PGND pads	PGND	PWR	Ground of the power stage. Should be connected to the system's power ground plane.
9-12, 24-29, SW Pad	SW	PWR	Switching node. It is internally connected. Use thermal vias and/or sufficient PCB land area in order to heatsink the low-side FET and the inductor.
30-53, VOUT pads	VOUT	PWR	Output of the power stage. Place the output filter capacitors as close as possible to these pins.
56-62, PVIN Pad	PVIN	PWR	Power stage input voltage. Place the input filter capacitors as close as possible to these pins.
63, 64, BST Pad	BST	A	Controller high-side driver supply pin. It is internally connected to SW via a 0.1uF bootstrap capacitor. Leave these pins floating.
65	ILIM	A	Over-current protection programming. Connect with a short trace to SW pins.
66	EN/MODE	I	Precision enable pin. Pulling this pin above 1.9V will turn the IC on and it will operate in Forced CCM. If the voltage is raised above 3.0V, then the IC will operate in DCM or CCM depending on load.
68	TON	A	Constant on-time programming pin. Connect with a resistor to AGND.

Type: A = Analog, I = Input, O = Output, I/O = Input/Output, PWR = Power, OD = Open-Drain

Functional Description

XR79115 is a synchronous step-down proprietary emulated current-mode Constant On-Time (COT) Module. The on-time, which is programmed via R_{ON} , is inversely proportional to V_{IN} and maintains a nearly constant frequency. The emulated current-mode control is stable with ceramic output capacitors.

Each switching cycle begins with GH signal turning on the high-side (switching) FET for a preprogrammed time. At the end of the on-time, the high-side FET is turned off and the low-side (synchronous) FET is turned on for a preset minimum time (250ns nominal). This parameter is termed Minimum Off-Time. After the minimum off-time, the voltage at the feedback pin FB is compared to an internal voltage ramp at the feedback comparator. When V_{FB} drops below the ramp voltage, the high-side FET is turned on and the cycle repeats. This voltage ramp constitutes an emulated current ramp and makes possible the use of ceramic capacitors, in addition to other capacitor types, for output filtering.

Enable/Mode Input (EN/MODE)

EN/MODE pin accepts a tri-level signal that is used to control turn on/off. It also selects between two modes of operation: 'Forced CCM' and 'DCM/CCM'. If EN is pulled below 1.8V, the Module shuts down. A voltage between 2.0V and 2.8V selects the Forced CCM mode which will run the Module in continuous conduction at all times. A voltage higher than 3.1V selects the DCM/CCM mode which will run the Module in discontinuous conduction at light loads.

Selecting the Forced CCM Mode

In order to set the Module to operate in Forced CCM, a voltage between 2.0V and 2.8V must be applied to EN/MODE. This can be achieved with an external control signal that meets the above voltage requirement. Where an external control is not available, the EN/MODE can be derived from V_{IN} . If V_{IN} is well regulated, use a resistor divider and set the voltage to 2.5V. If V_{IN} varies over a wide range, the circuit shown in figure 25 can be used to generate the required voltage. Note that at V_{IN} of 5V and 22V the nominal Zener voltage is 3.8V and 4.7V respectively. Therefore for V_{IN} in the range of 5V to 22V, the circuit shown in figure 25 will generate V_{EN} required for Forced CCM.

Selecting the DCM/CCM Mode

In order to set the Module operation to DCM/CCM, a voltage between 3.1V and 5.5V must be applied to EN/MODE pin. If an external control signal is available, it can be directly connected to EN/MODE. In applications where an external control is not available, EN/MODE input can be derived from V_{IN} . If V_{IN} is well regulated, use a resistor

divider and set the voltage to 4V. If V_{IN} varies over a wide range, the circuit shown in figure 26 can be used to generate the required voltage.

Figure 25: Selecting Forced CCM by deriving EN/MODE from V_{IN}

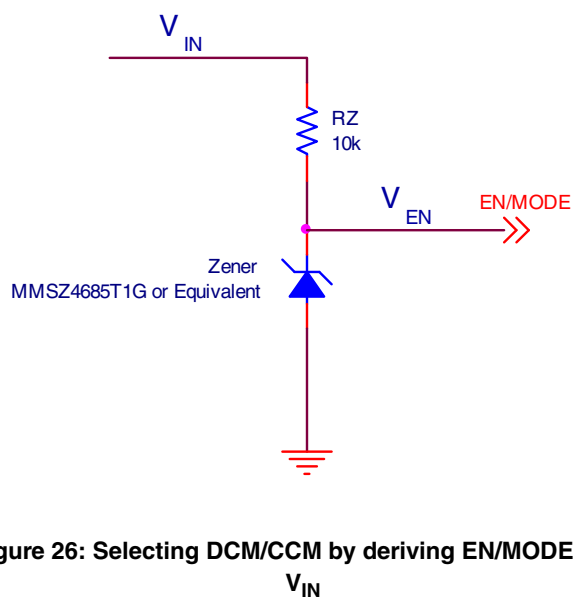

Figure 26: Selecting DCM/CCM by deriving EN/MODE from V_{IN}

Programming the On-Time

The On-Time T_{ON} is programmed via resistor R_{ON} according to following equation:

$$R_{ON} = \frac{V_{IN} \times [T_{ON} - (25 \times 10^{-9})]}{2.85 \times 10^{-10}}$$

where T_{ON} is calculated from:

$$T_{ON} = \frac{V_{OUT}}{V_{IN} \times f \times Eff}$$

where:

f is the desired switching frequency at nominal I_{OUT}

Eff is the Module efficiency corresponding to nominal I_{OUT} shown in figures 19, 21, 23

Substituting for T_{ON} in the first equation we get:

$$R_{ON} = \frac{\left(\frac{V_{OUT}}{f \times Eff}\right) - [(25 \times 10^{-9}) \times V_{IN}]}{2.85 \times 10^{-10}}$$

Over-Current Protection (OCP)

If load current exceeds the programmed over-current, I_{OCP} for four consecutive switching cycles, then Module enters hiccup mode of operation. In hiccup, the MOSFET gates are turned off for 110ms (hiccup timeout). Following the hiccup timeout, a soft-start is attempted. If OCP persists, hiccup timeout will repeat. The Module will remain in hiccup mode until load current is reduced below the programmed I_{OCP} . In order to program the over-current protection, use the following equation:

$$RLIM = \frac{(I_{OCP} \times R_{DS}) + 8mV}{ILIM}$$

Where:

$RLIM$ is resistor value for programming I_{OCP}

I_{OCP} is the over-current threshold to be programmed

R_{DS} is the MOSFET rated On Resistance (5m Ω)

8mV is the OCP comparator maximum offset

$ILIM$ is the internal current that generates the necessary OCP comparator threshold (use 45 μ A).

Note that $ILIM$ has a positive temperature coefficient of 0.4%/°C (figure 9). This is meant to roughly match and compensate for positive temperature coefficient of the synchronous FET. Graph of typical I_{OCP} versus $RLIM$ is shown in figure 7.

Short-Circuit Protection (SCP)

If the output voltage drops below 60% of its programmed value, the Module will enter hiccup mode. Hiccup will persist until short-circuit is removed. SCP circuit becomes active after PGOOD asserts high.

Over-Temperature (OTP)

OTP triggers at a nominal die temperature of 150°C. The gate of switching FET and synchronous FET are turned off. When die temperature cools down to 135°C, soft-start is initiated and operation resumes.

Programming the Output Voltage

Use an external voltage divider as shown in the Application Circuit to program the output voltage V_{OUT} .

$$R1 = R2 \times \left(\frac{V_{OUT}}{0.6} - 1\right)$$

where $R2$ has a nominal value of 2k Ω .

Programming the Soft-start

Place a capacitor CSS between the SS and AGND pins to program the soft-start. In order to program a soft-start time of TSS, calculate the required capacitance CSS from the following equation:

$$CSS = TSS \times \left(\frac{10\mu A}{0.6V}\right)$$

Feed-Forward Capacitor (C_{FF})

A feed-forward capacitor (C_{FF}) may be necessary depending on the Equivalent Series Resistance (ESR) of C_{OUT} . If

only ceramic output capacitors are used for C_{OUT} then a C_{FF} is necessary. Calculate C_{FF} from:

$$C_{FF} = \frac{1}{2 \times \pi \times 80kHz \times R1}$$

where:

$R1$ is the resistor that C_{FF} is placed in parallel with

80kHz is the location of the Zero formed by $R1$ and C_{FF}

Note that minimum required C_{OUT} is 140uF when using ceramic capacitors.

When using capacitors with higher ESR, such as PANASONIC TPE series, a C_{FF} is not required provided following conditions are met:

1. The frequency of output filter LC double-pole f_{LC} should be less than 15kHz.
2. The frequency of ESR Zero $f_{Zero,ESR}$ should be at least three times larger than f_{LC} .

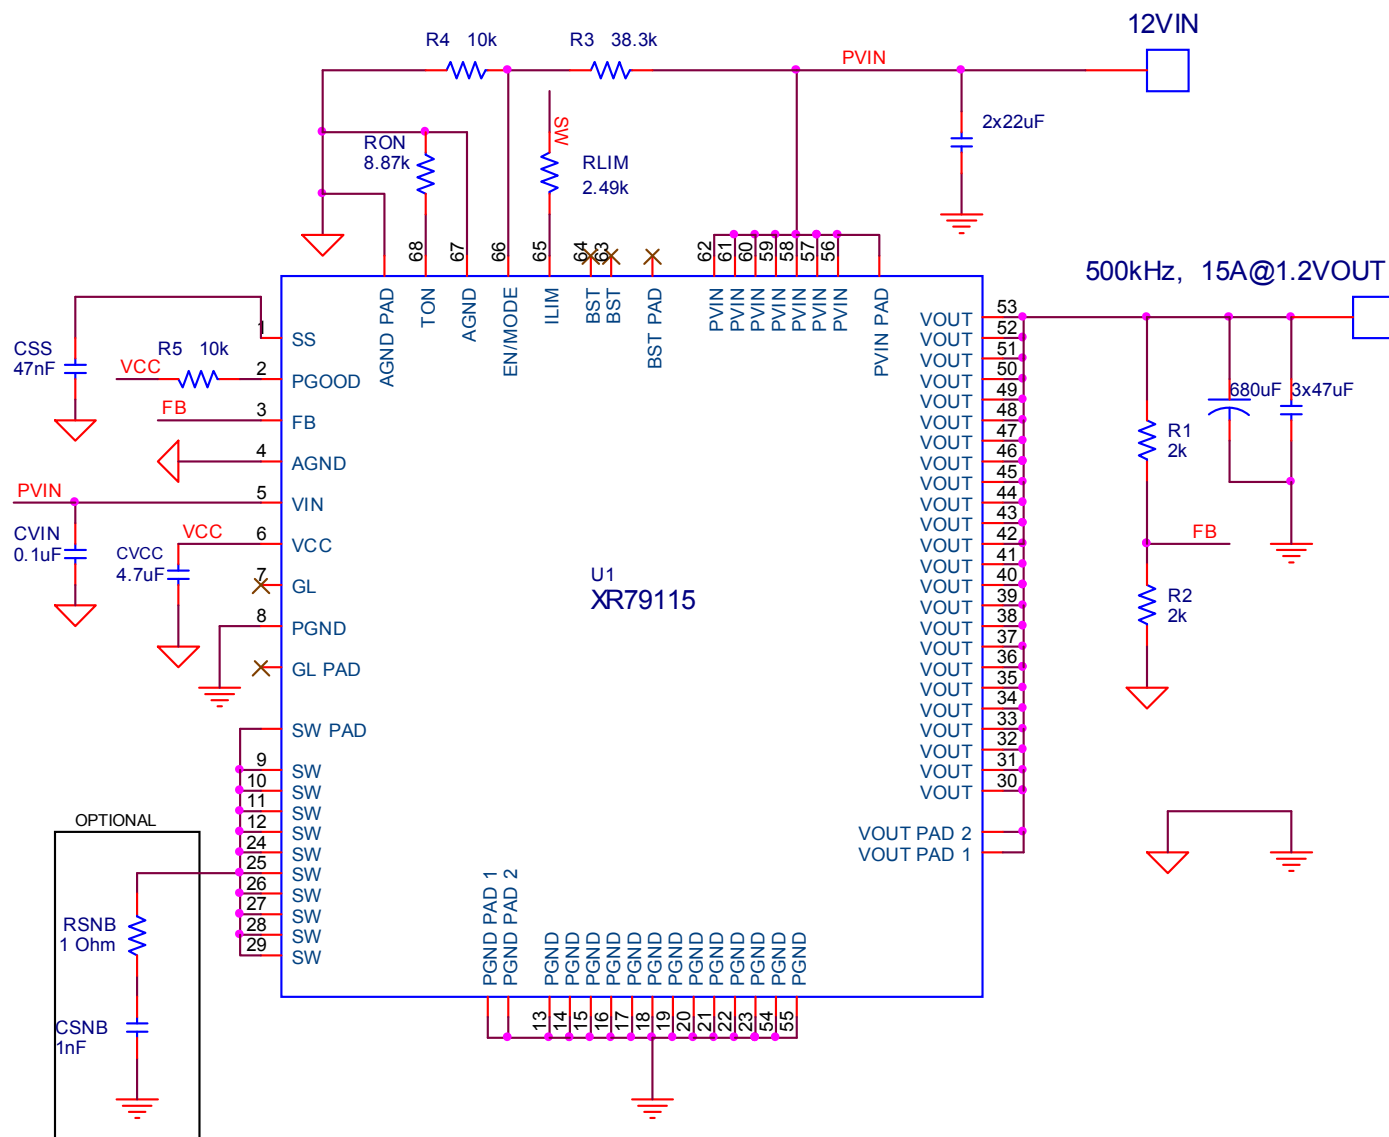

As an example the application circuit has $f_{LC}=8.3kHz$ and $f_{Zero,ESR}=23.4kHz$.

Note that the steady-state voltage ripple at feedback pin FB ($V_{FB,RIPPLE}$) must not exceed 50mV in order for Module to function correctly. If $V_{FB,RIPPLE}$ is larger than 50mV then C_{OUT} should be increased as necessary in order to keep the $V_{FB,RIPPLE}$ below 50mV.

Feed-Forward Resistor (R_{FF})

Poor PCB layout can cause FET switching noise at the output and may couple to the FB pin via C_{FF} . Excessive noise at FB will cause poor load regulation. To solve this problem place a resistor R_{FF} in series with C_{FF} . R_{FF} value up to 2% of $R1$ is acceptable.
