

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

GENERAL DESCRIPTION

The XRT59L921 is an optimized twenty-one channel, E1, line interface unit, fabricated using low power CMOS technology. The device contains twenty-one independent E1 channels. It is primarily targeted towards the SDH multiplexers that accommodate TU12 Tributary Unit Frames. Line cards in these units multiplex 21 E1 channels into higher SDH rates. Devices with 21 E1 interfaces such as the XRT59L921 provide the most efficient method of implementing 63-channel line cards. Each channel performs the driver and receiver functions necessary to convert bipolar signals to logical levels and vice versa.

The receiver input accepts transformer coupled 1:1 signals, while the transmitter is coupled to the line using a 1:2 transformer. The same transformer configuration can be used for both balanced and unbalanced interfaces. The device offers Loss of Signal (LOS) detection, that provides an LOS output indication signal with thresholds and delay that comply with the ITU G.775 requirements.

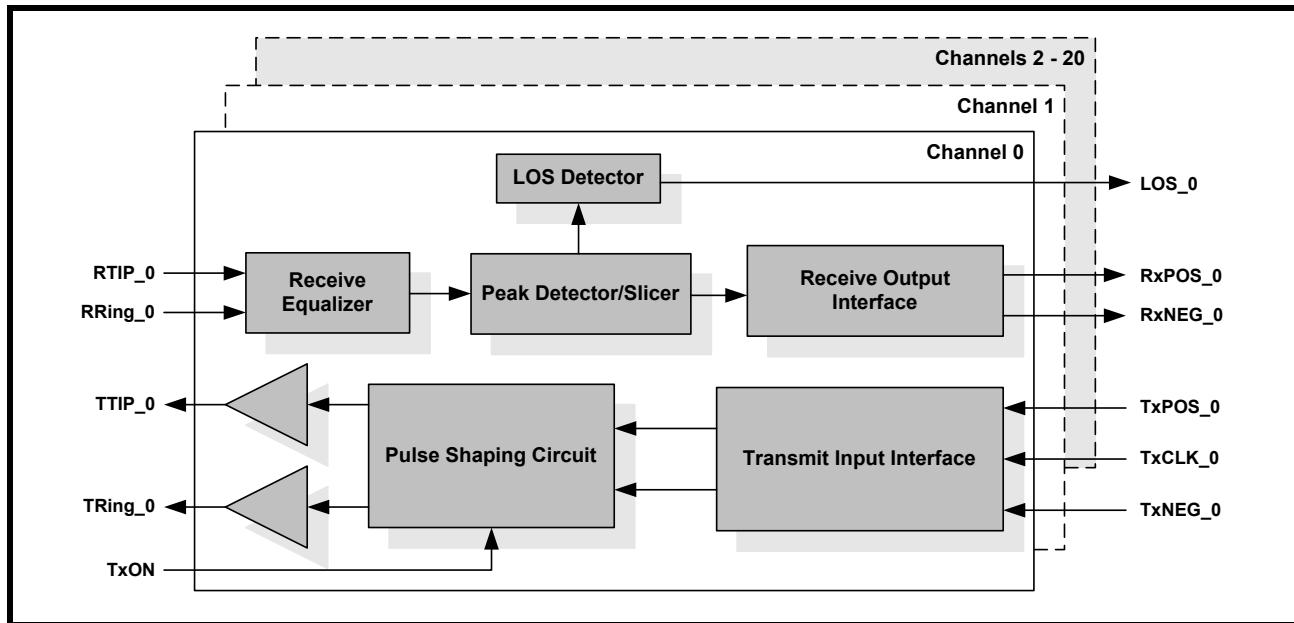

FEATURES

- Twenty-One (21) Independent E1 (CEPT) Line Interface Units (Transmitter, Receiver, and Recovery)
- Transmit Output Pulses that are Compliant with the ITU-T G.703 Pulse Template Requirement for 2.048Mbps (E1) Rates
- On-Chip Pulse Shaping for both 75Ω and 120Ω line drivers
- Detects and Clears LOS (Loss of Signal) Per ITU-T G.775
- Operates over the Industrial Temperature Range
- Ultra Low power consumption
- 3.3V operation with 5V Tolerant Input

APPLICATIONS

- PDH Multiplexers
- SDH Multiplexers
- Digital Cross-Connect Systems
- DECT (Digital European Cordless Telephone) Base Stations
- CSU/DSU Equipment

Power Consumption	PC	-	650		mW	120Ω load, operating at 50% Mark Density.
Power Consumption	PC	-	1000		mW	75Ω load, operating at 100% Mark Density.
Power Consumption	PC	-	900		mW	120Ω load, operating at 100% Mark Density.
Power Consumption	PC	-	170		mW	Transmitter in Powered-down mode.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature	-65°C to + 150°C	
Operating Temperature	-40°C to + 85°C	
ESD Rating	>2000V on all pins	NOTE: Human Body Model, 100pF capacitor discharged through a 1.5KΩ resistor.
Supply Voltage	-0.5V to + 6.0V	

SYSTEM DESCRIPTION

The XRT59L921 is a Twenty-One (21) channel E1 transceiver that provides an electrical interface for 2.048Mbps applications. Each of the twenty-one channels includes a receive circuit that converts an ITU-T G.703 compliant bipolar signal into a TTL compatible logic levels. Each receiver also includes an LOS (Loss of Signal) detection circuit. Similarly, in the Transmit Direction, each Transmitter converts TTL compatible logic levels into a G.703 compatible bipolar signal. The Transmitter may be operated in either a Clock or Clockless Mode.

Each channel within the XRT59L921 LIU consists of both a Transmit Section and a Receive Section, each of these sections will be discussed in detail below.

1.0 THE TRANSMIT SECTION

In general, the purpose of the Transmit Section (within each channel of the XRT59L921) is to accept TTL/CMOS level digital data (from the Terminal Equipment), and to encode it into a format such that it can:

1. Be efficiently transmitted over coaxial- or twistedpair cable at the E1 data rate and
2. Be reliably received by the Remote Terminal Equipment at the other end of the E1 data link.
3. Comply with the ITU-T G.703 pulse template requirements, for E1 applications.

The circuitry that the Transmit Section (within the XRT59L921) uses to accomplish this goal is discussed below. The Transmit Section of the XRT59L921 consists of the following blocks:

- Transmit Input Interface
- Pulse Shaping Block

1.1 *The Transmit Input Interface*

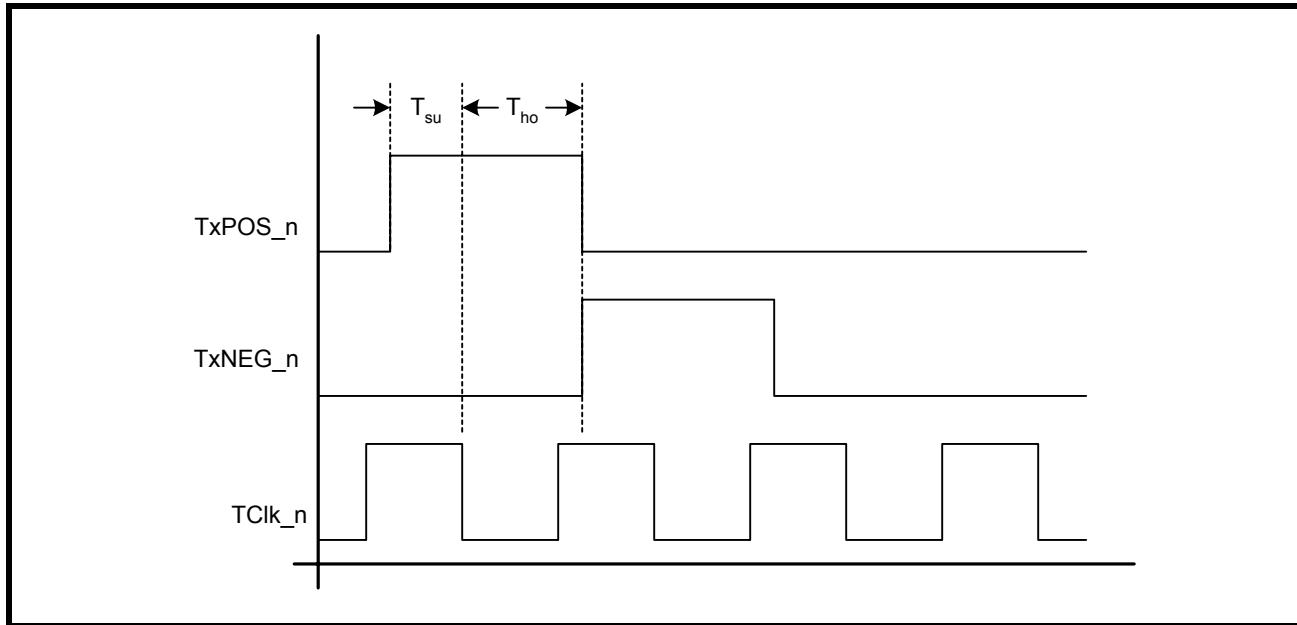

The Transmit Input Interface accepts either Clock or clockless data from the Terminal Equipment. The manner in how the Terminal Equipment should apply data to a given channel within the XRT59L921 depends upon whether the channel is being operated in the Clock or clockless mode.

1.2 *Operating the Transmitter in the Clock Mode*

The user can configure a given channel (within the XRT59L921) to operate in the Clock mode by simply applying a 2.048MHz clock signal to the TxClk_n input pin (where x denotes a given channel within the XRT59L921). The XRT59L921 contains circuitry that senses activity on the TxClk_n line. If this circuit senses activity on the TxClk_n line, then the corresponding channel will automatically be operating in the Clock Mode.

In the Clock Mode, the Terminal Equipment is expected to apply a 2.048MHz clock signal at the TxClk_n input pin and NRZ data at the TxPOS_n and TxNEG_n input pins. The Transmit Input Interface circuit will sample the data, at the TxPOS_n and TxNEG_n input pins, upon the falling edge of TxClk_n, as illustrated in [Figure 4](#).

FIGURE 4. ILLUSTRATION ON HOW THE XRT59L921 SAMPLES THE DATA ON THE TxPOS_N AND TxNEG_N INPUT PINS

In general, if the XRT59L921 samples a “1” on the TxPOS_n input pin, then the Transmit Section of the device will ultimately generate a positive polarity pulse via the TTIP_n and TRing_n output pins (across a 1:2 transformer). Conversely, if the XRT59L921 samples a “1” on the TxNEG_n input pin, then the Transmit Section of the device will ultimately generate a negative polarity pulse via the TTIP_n and TRing_n output pins (across a 1:2 transformer).

1.2.1 Operating the Transmitter in the Clockless Mode

The user can configure a given channel (within the XRT59L921) to operate in the Clockless mode by doing the following:

- Not applying a clock signal to the TClk_n input, and pulling this pin to VDD.
- By applying RZ (Return to Zero) data to the TxPOS_n and TxNEG_n input pins, as illustrated below.
- If TClk_n is grounded and RZ data is applied to TPOS and TNEG, the transmitter will be powered down and tri-stated.

1.2.2 Shutting off the Transmitter

The Transmit Driver for each Channel_n (within the XRT59L921) can be shut off. To activate this feature, Connect the TxCLK_n input pin to a logic "0" (e.g. GND) and continue to apply data via the TxPOS_n and TxNEG_n input pins.

FIGURE 5. ILLUSTRATION ON HOW THE TERMINAL EQUIPMENT SHOULD APPLY DATA TO THE TRANSMIT SECTION OF A GIVEN CHANNEL (WITHIN THE XRT59L921), WHEN OPERATING IN THE CLOCKLESS MODE

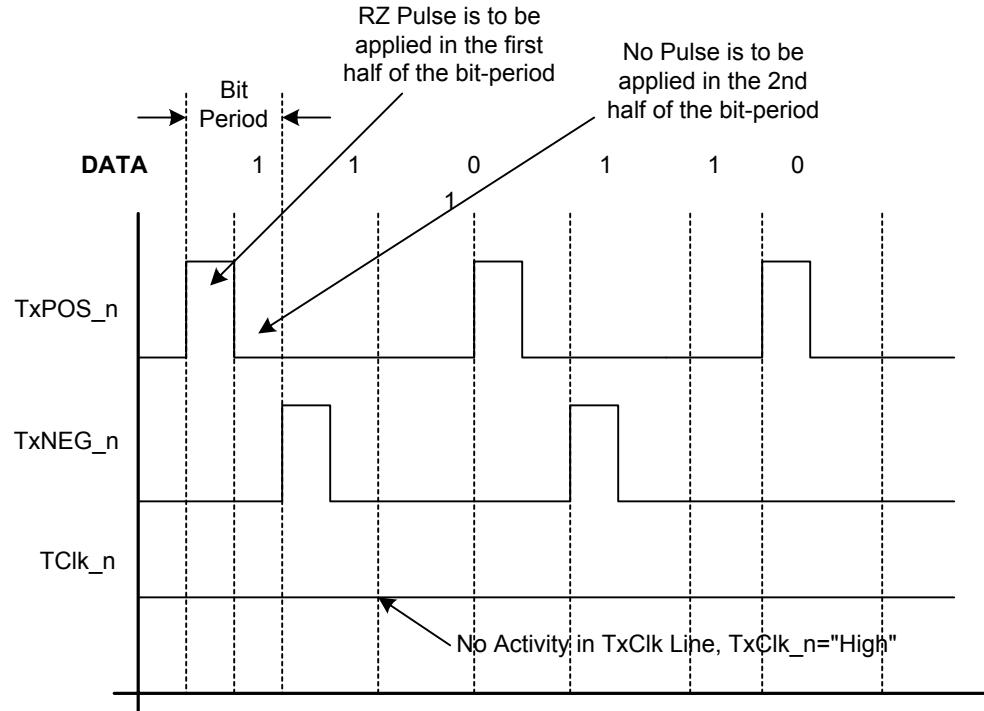

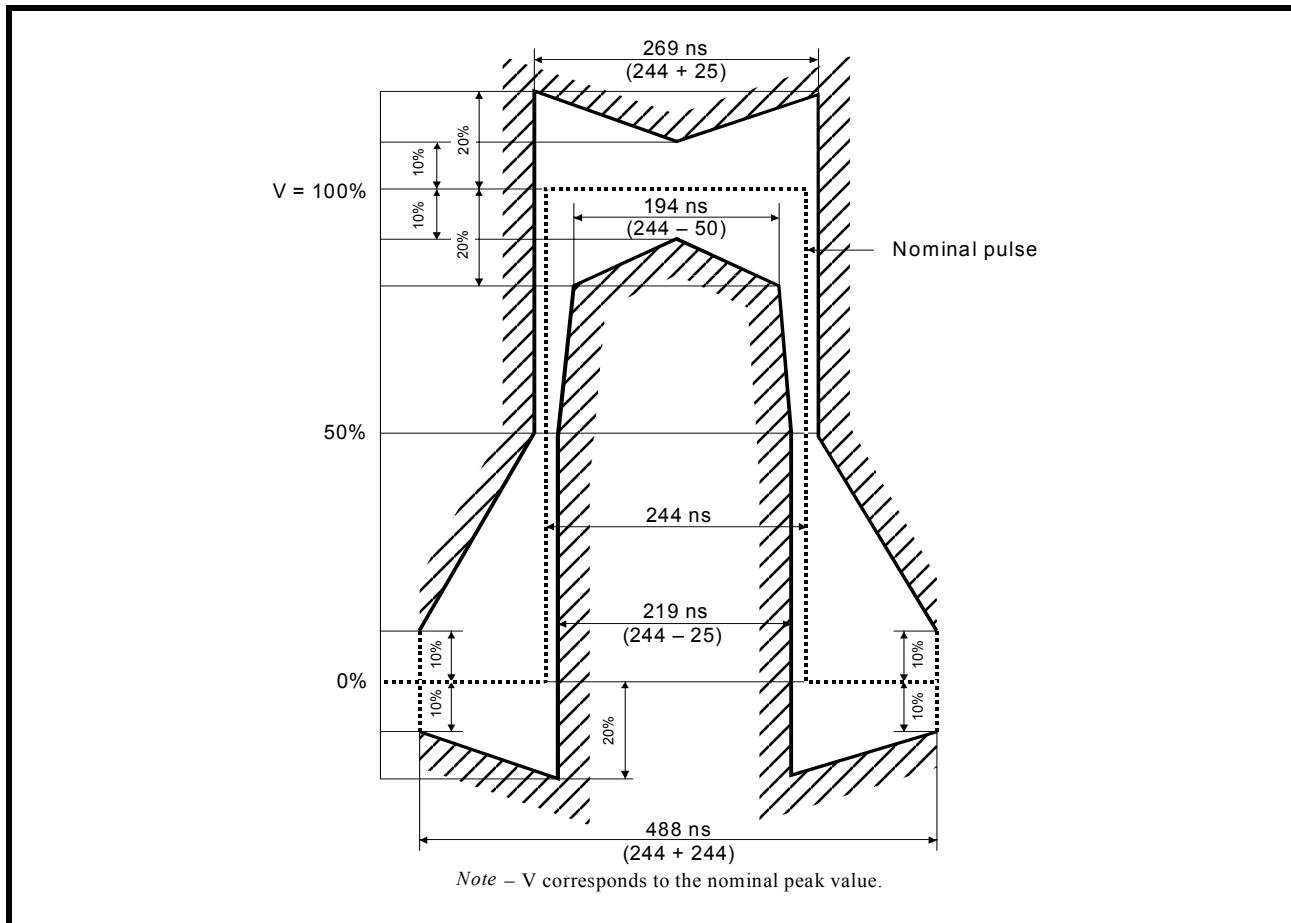

Figure 5, indicates that when the user is operating a channel in the Clockless Mode, then the corresponding Terminal Equipment must do the following:

- Not apply a signal on the TClk_n line and connect TClk to "High"
- When applying a pulse (to either the TxPOS_n or TxNEG_n input pin), apply an RZ pulse to the appropriate input pin. This RZ pulse should only have a width of one-half the bit-period.

1.3 The Pulse Shaping Circuit

The purpose of the Transmit Pulse Shaping circuit is to generate Transmit Output pulses that comply with the ITU-T G.703 Pulse Template Requirements for E1 Applications.

FIGURE 6. ILLUSTRATION OF THE ITU-T G.703 PULSE TEMPLATE FOR E1 APPLICATIONS

Each channel (within the XRT59L921) will take each mark (which is provided to it via the Transmit Input Interface block, and will generate a pulse that complies with the pulse template, presented in **Figure 6**, (when measured on the secondary-side of the Transmit Output Transformer).

1.4 Interfacing the Transmit Sections of the XRT59L921 to the Line

ITU-T G.703 specifies that the E1 line signal can be transmitted over coaxial cable and terminated with 75Ω or transmitted over twisted-pair and terminated with 120Ω . However, in both applications (e.g., 75Ω or 120Ω), the user is advised to interface the Transmitter to the Line, in the manner as depicted in **Figure 7** and **Figure 8**, respectively.

FIGURE 7. ILLUSTRATION OF HOW TO INTERFACE THE TRANSMIT SECTIONS OF THE XRT59L921 TO THE LINE (FOR 75Ω APPLICATIONS)

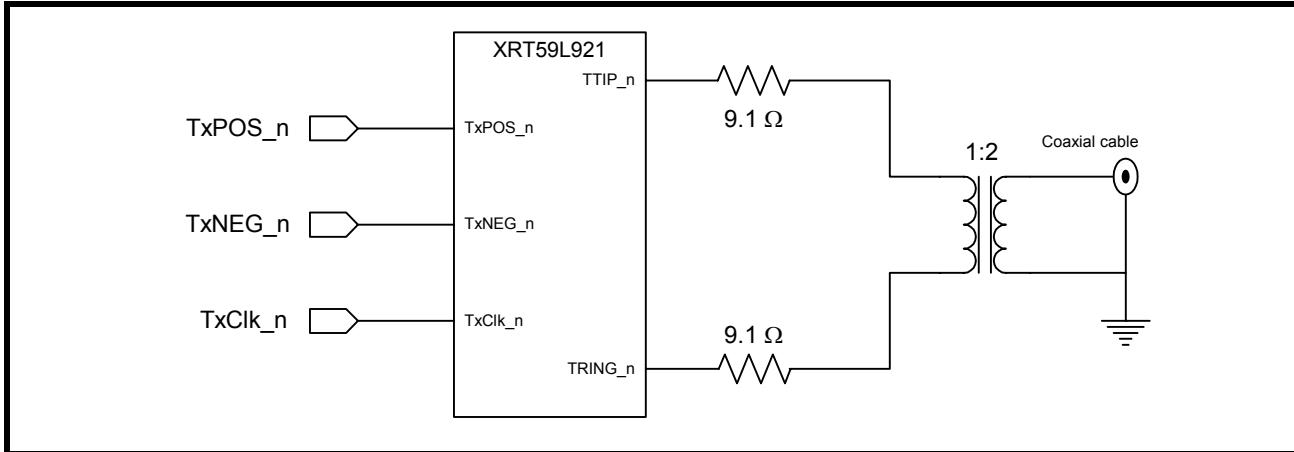

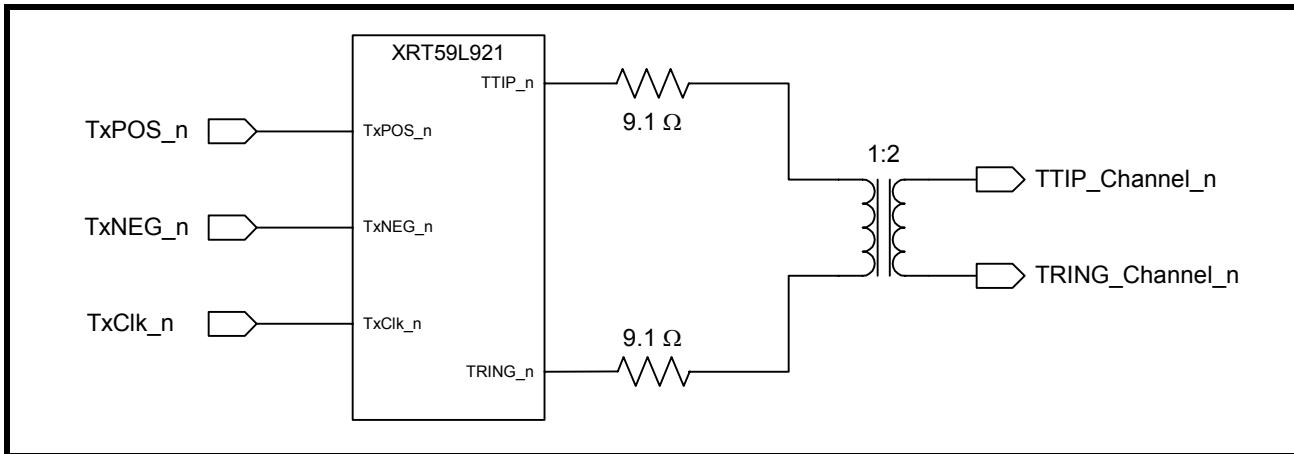

FIGURE 8. ILLUSTRATION OF HOW TO INTERFACE THE TRANSMIT SECTIONS THE XRT59L921 TO THE LINE (FOR 120Ω APPLICATIONS)

NOTES:

1. **Figure 7 and Figure 8,** indicate that for both 75Ω and 120Ω applications, the user should connect a 9.1Ω resistor, in series, between the TTIP/TRing outputs and the transformers.
2. **Figure 5 and 6,** indicate that the user should use a 1:2 STEP-UP Transformer.

TRANSMIT TRANSFORMER RECOMMENDATIONS

PARAMETER	VALUE
Turns Ratio	1:2
Primary Inductance	
Isolation Voltage	
Leakage Inductance	

THE FOLLOWING TRANSFORMERS ARE RECOMMENDED FOR USE

PART NUMBER	VENDOR	ISOLATION	PACKAGE TYPE
PE-65835	Pulse		
TTI 7154-R	Transpower Technologies, Inc.		
TG26-1205	HALO		

NOTE: More transformers will be added to this list as they are evaluated .

2.0 THE RECEIVE SECTION

The Receive Sections of the XRT59L921 consists of the following blocks:

- The Receive Equalizer block
- The Peak Detector and Slicer block
- The LOS Detector block
- The Receive Output Interface block

2.1 *Interfacing the Receive Sections to the Line (Transformer Coupling)*

The design of each channel (within the XRT59L921) permits the user to transformer-couple the Receive Section to the line. Additionally, as mentioned earlier, the specification documents for E1 specify 75Ω termination loads, when transmitting over coaxial cable, and 120Ω loads, when transmitting over twisted-pair. **Figure 9**, and **Figure 10** present the two methods that the user can employ in order to interface the Receivers (of the XRT59L921) to the line.

FIGURE 9. RECOMMENDED SCHEMATIC FOR INTERFACING THE RECEIVE SECTIONS OF THE XRT59L921 TO THE LINE FOR 75Ω APPLICATIONS (TRANSFORMER-COUPLING)

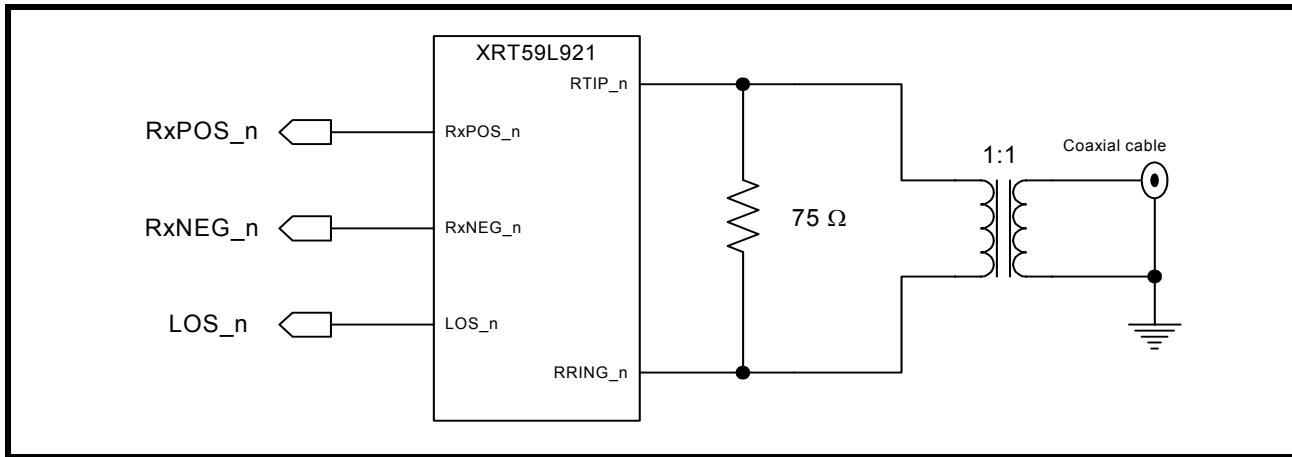

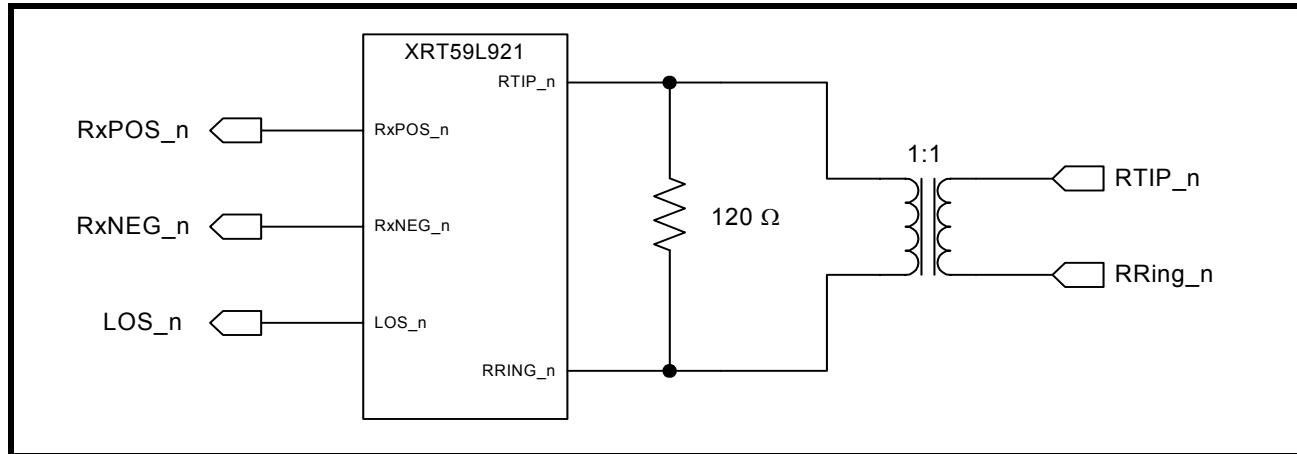

FIGURE 10. RECOMMENDED SCHEMATIC FOR INTERFACING THE RECEIVE SECTIONS OF THE XRT59L921 TO THE LINE FOR 120Ω APPLICATIONS (TRANSFORMER-COUPLING)

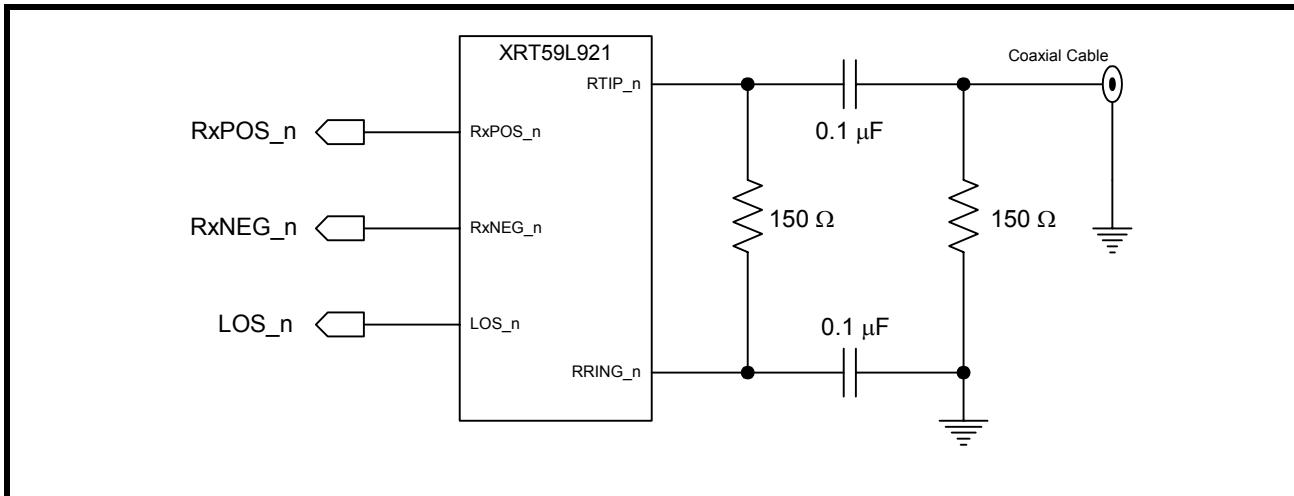

NOTE: Figure 9 and Figure 10 indicate that the user should use a 1:1 transformer, when interfacing the receiver to the line.
