

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

GENERAL DESCRIPTION

The XRT75R06 is a six channel fully integrated Line Interface Unit (LIU) featuring EXAR's R³ Technology (Reconfigurable, Relayless, Redundancy) for E3/DS3/STS-1 applications. The LIU incorporates 6 independent Receivers, Transmitters and Jitter Attenuators in a single 217 Lead BGA package.

Each channel of the XRT75R06 can be independently configured to operate in E3 (34.368 MHz), DS3 (44.736 MHz) or STS-1 (51.84 MHz). Each transmitter can be turned off and tri-stated for redundancy support or for conserving power.

The XRT75R06's differential receiver provides high noise interference margin and is able to receive data over 1000 feet of cable or with up to 12 dB of cable attenuation.

The XRT75R06 incorporates an advanced crystal-less jitter attenuator per channel that can be selected either in the transmit or receive path. The jitter

attenuator performance meets the ETSI TBR-24 and Bellcore GR-499 specifications.

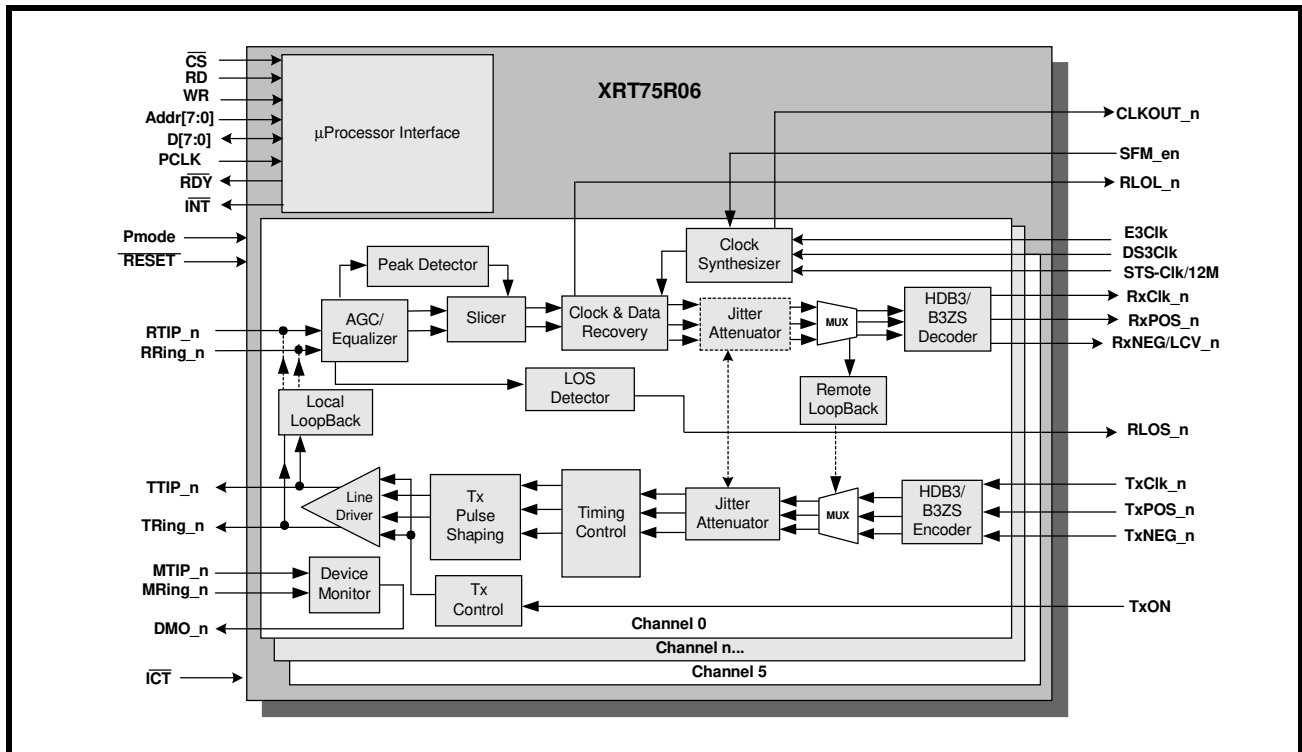

The XRT75R06 provides a Parallel Microprocessor Interface for programming and control.

The XRT75R06 supports analog, remote and digital loop-backs. The device also has a built-in Pseudo Random Binary Sequence (PRBS) generator and detector with the ability to insert and detect single bit error for diagnostic purposes.

APPLICATIONS

- E3/DS3 Access Equipment
- DSLAMs
- Digital Cross Connect Systems
- CSU/DSU Equipment
- Routers
- Fiber Optic Terminals

FIGURE 1. BLOCK DIAGRAM OF THE XRT 75R06

ORDERING INFORMATION

PART NUMBER	PACKAGE	OPERATING TEMPERATURE RANGE
XRT75R06IB	217 Lead BGA	-40°C to +85°C

FEATURES

RECEIVER

- R³ Technology (Reconfigurable, Relayless, Redundancy)
- On chip Clock and Data Recovery circuit for high input jitter tolerance
- Meets E3/DS3/STS-1 Jitter Tolerance Requirement
- Detects and Clears LOS as per G.775
- Receiver Monitor mode handles up to 20 dB flat loss with 6 dB cable attenuation
- On chip B3ZS/HDB3 encoder and decoder that can be either enabled or disabled
- On-chip clock synthesizer provides the appropriate rate clock from a single 12.288 MHz Clock
- Provides low jitter output clock

TRANSMITTER

- R³ Technology (Reconfigurable, Relayless, Redundancy)
- Compliant with Bellcore GR-499, GR-253 and ANSI T1.102 Specification for transmit pulse
- Tri-state Transmit output capability for redundancy applications
- Each Transmitter can be independently turned on or off
- Transmitters provide Voltage Output Drive

JITTER ATTENUATOR

- On chip advanced crystal-less Jitter Attenuator for each channel
- Jitter Attenuator can be selected in Receive, Transmit path, or disabled
- Meets ETSI TBR 24 Jitter Transfer Requirements
- Compliant with jitter transfer template outlined in ITU G.751, G.752, G.755 and GR-499-CORE,1995 standards
- 16 or 32 bits selectable FIFO size

CONTROL AND DIAGNOSTICS

- Parallel Microprocessor Interface for control and configuration
- Supports optional internal Transmit driver monitoring

- Each channel supports Analog, Remote and Digital Loop-backs
- Single 3.3 V \pm 5% power supply
- 5 V Tolerant digital inputs
- Available in 217 pin BGA Package
- - 40°C to 85°C Industrial Temperature Range

TRANSMIT INTERFACE CHARACTERISTICS

- Accepts either Single-Rail or Dual-Rail data from Terminal Equipment and generates a bipolar signal to the line
- Integrated Pulse Shaping Circuit
- Built-in B3ZS/HDB3 Encoder (which can be disabled)
- Accepts Transmit Clock with duty cycle of 30%-70%
- Generates pulses that comply with the ITU-T G.703 pulse template for E3 applications
- Generates pulses that comply with the DSX-3 pulse template, as specified in Bellcore GR-499-CORE and ANSI T1.102_1993
- Generates pulses that comply with the STSX-1 pulse template, as specified in Bellcore GR-253-CORE
- Transmitter can be turned off in order to support redundancy designs

RECEIVE INTERFACE CHARACTERISTICS

- Integrated Adaptive Receive Equalization (optional) for optimal Clock and Data Recovery
- Declares and Clears the LOS defect per ITU-T G.775 requirements for E3 and DS3 applications
- Meets Jitter Tolerance Requirements, as specified in ITU-T G.823_1993 for E3 Applications
- Meets Jitter Tolerance Requirements, as specified in Bellcore GR-499-CORE for DS3 Applications
- Declares Loss of Lock (LOL) Alarm
- Built-in B3ZS/HDB3 Decoder (which can be disabled)
- Recovered Data can be muted while the LOS Condition is declared
- Outputs either Single-Rail or Dual-Rail data to the Terminal Equipment

Set the RxCLKINV bit to sample RPOS/RNEG data on the falling edge of RxCLK
A1 U1 A16 U16 D9 P9	RPOS_0 RPOS_1 RPOS_2 RPOS_3 RPOS_4 RPOS_5	○	Receive Positive Data Output - Channel 0: Receive Positive Data Output - Channel 1: Receive Positive Data Output - Channel 2: Receive Positive Data Output - Channel 3: Receive Positive Data Output - Channel 4: Receive Positive Data Output - Channel 5: <i>NOTE: If the B3ZS/HDB3 Decoder is enabled in Single-rail mode, then the zero suppression patterns in the incoming line signal (such as: "00V", "000V", "B0V", "B00V") are removed and replaced with '0'.</i>
B2 T2 B16 T16 D10 P10	RNEG_0/ LCV_0 RNEG_1/ LCV_1 RNEG_2/ LCV_2 RNEG_3/ LCV_3 RNEG_4/ LCV_4 RNEG_5/ LCV_5	○	Receive Negative Data Output/Line Code Violation Indicator - Channel 0: Receive Negative Data Output/Line Code Violation Indicator - Channel 1: Receive Negative Data Output/Line Code Violation Indicator - Channel 2: Receive Negative Data Output/Line Code Violation Indicator - Channel 3: Receive Negative Data Output/Line Code Violation Indicator - Channel 4: Receive Negative Data Output/Line Code Violation Indicator - Channel 5: In Dual Rail mode, a negative pulse is output through RNEG. Line Code Violation Indicator - Channel n: If configured in Single Rail mode then Line Code Violation will be output.

RECEIVE INTERFACE

LEAD #	SIGNAL NAME	TYPE	DESCRIPTION
A5 U5 A14 U14 A9 U9	RRING_0 RRING_1 RRING_2 RRING_3 RRING_4 RRING_5	I	Receive Input - Channel 0: Receive Input - Channel 1: Receive Input - Channel 2: Receive Input - Channel 3: Receive Input - Channel 4: Receive Input - Channel 5: These pins along with RTIP receive the bipolar line signal from the remote DS3/E3/STS-1 Terminal.
A6 U6 A13 U13 A10 U10	RTIP_0 RTIP_1 RTIP_2 RTIP_3 RTIP_4 RTIP_5	I	Receive Input - Channel 0: Receive Input - Channel 1: Receive Input - Channel 2: Receive Input - Channel 3: Receive Input - Channel 4: Receive Input - Channel 5: These pins along with RRING receive the bipolar line signal from the Remote DS3/E3/STS-1 Terminal.

CLOCK INTERFACE

LEAD #	SIGNAL NAME	TYPE	DESCRIPTION
E15	E3CLK	I	<p>E3 Clock Input (34.368 MHz ± 20 ppm): If any of the channels is configured in E3 mode, a reference clock 34.368 MHz is applied on this pin.</p> <p>NOTE: <i>In single frequency mode, this reference clock is not required.</i></p>
G16	DS3CLK	I	<p>DS3 Clock Input (44.736 MHz ± 20 ppm): If any of the channels is configured in DS3 mode, a reference clock 44.736 MHz. is applied on this pin.</p> <p>NOTE: <i>In single frequency mode, this reference clock is not required.</i></p>
C16	STS-1CLK/ 12M	I	<p>STS-1 Clock Input (51.84 MHz ± 20 ppm): If any of the channels is configured in STS-1 mode, a reference clock 51.84 MHz is applied on this pin..</p> <p>In Single Frequency Mode, a reference clock of 12.288 MHz ± 20 ppm is connected to this pin and the internal clock synthesizer generates the appropriate clock frequencies based on the configuration of the channels in E3, DS3 or STS-1 modes.</p>
L15	SFM_EN	I	<p>Single Frequency Mode Enable: Tie this pin "High" to enable the Single Frequency Mode. A reference clock of 12.288 MHz ± 20 ppm is applied.</p> <p>In the Single Frequency Mode (SFM) a low jitter output clock is provided for each channel if the CLK_EN bit is set thus eliminating the need for a separate clock source for the framer.</p> <p>Tie this pin "Low" if single frequency mode is not selected. In this case, the appropriate reference clocks must be provided.</p> <p>NOTE: <i>This pin is internally pulled down</i></p>
B1 T1 B17 T17 D11 P11	CLKOUT_0 CLKOUT_1 CLKOUT_2 CLKOUT_3 CLKOUT_4 CLKOUT_5	O	<p>Clock output for channel 0 Clock output for channel 1 Clock output for channel 2 Clock output for channel 3 Clock output for channel 4 Clock output for channel 5</p> <p>Low jitter clock output for each channel based on the mode selection (E3,DS3 or STS-1) if the CLKOUTEN_n bit is set in the control register.</p> <p>This eliminates the need for a separate clock source for the framer.</p> <p>NOTES:</p> <ol style="list-style-type: none"> <i>The maximum drive capability for the clockouts is 16 mA.</i> <i>This clock out is available both in SFM and non-SFM modes.</i>

CONTROL AND ALARM INTERFACE

LEAD #	SIGNAL NAME	TYPE	DESCRIPTION
B7 R6 C14 R14 C6 D14	MRING_0 MRING_1 MRING_2 MRING_3 MRING_4 MRING_5	I	<p>Monitor Ring Input - Channel 0: Monitor Ring Input - Channel 1: Monitor Ring Input - Channel 2: Monitor Ring Input - Channel 3: Monitor Ring Input - Channel 4: Monitor Ring Input - Channel 5:</p> <p>The bipolar line output signal from TRING_n is connected to this pin via a 270 Ω resistor to check for line driver failure.</p> <p><i>NOTE: This pin is internally pulled up.</i></p>
B8 R7 C13 R13 C7 D13	MTIP_0 MTIP_1 MTIP_2 MTIP_3 MTIP_4 MTIP_5	I	<p>Monitor Tip Input - Channel 0: Monitor Tip Input - Channel 1: Monitor Tip Input - Channel 2: Monitor Tip Input - Channel 3: Monitor Tip Input - Channel 4: Monitor Tip Input - Channel 5:</p> <p>The bipolar line output signal from TTIP_n is connected to this pin via a 270-ohm resistor to check for line driver failure.</p> <p><i>NOTE: This pin is internally pulled up.</i></p>
C5 T4 B12 T12 D5 B15	DMO_0 DMO_1 DMO_2 DMO_3 DMO_4 DMO_5	O	<p>Drive Monitor Output - Channel 0: Drive Monitor Output - Channel 1: Drive Monitor Output - Channel 2: Drive Monitor Output - Channel 3: Drive Monitor Output - Channel 4: Drive Monitor Output - Channel 5:</p> <p>If MTIP_n and MRING_n has no transition pulse for 128 ± 32 TxCLK_n cycles, DMO_n goes "High" to indicate the driver failure. DMO_n output stays "High" until the next AMI signal is detected.</p>
C8 T7 C12 T11 B11 R8	RLOS_0 RLOS_1 RLOS_2 RLOS_3 RLOS_4 RLOS_5	O	<p>Receive Loss of Signal - Channel 0: Receive Loss of Signal - Channel 1: Receive Loss of Signal - Channel 2: Receive Loss of Signal - Channel 3: Receive Loss of Signal - Channel 4: Receive Loss of Signal - Channel 5:</p> <p>This output pin toggles "High" if the receiver has detected a Loss of Signal Condition.</p>

CONTROL AND ALARM INTERFACE

C9 T8 D12 R11 C11 R9	RLOL_0 RLOL_1 RLOL_2 RLOL_3 RLOL_4 RLOL_5	O	Receive Loss of Lock - Channel 0: Receive Loss of Lock - Channel 1: Receive Loss of Lock - Channel 2: Receive Loss of Lock - Channel 3: Receive Loss of Lock - Channel 4: Receive Loss of Lock - Channel 5: This output pin toggles "High" if a Loss of Lock Condition is detected. LOL (Loss of Lock) condition occurs if the recovered clock frequency deviates from the Reference Clock frequency (available at either E3CLK or DS3CLK or STS-1CLK input pins) by more than 0.5%.
L16	RXA	****	External Resistor of 3.01K $\Omega \pm 1\%$. Should be connected between RxA and RxB for internal bias.
K16	RXB	****	External Resistor of 3.01K $\Omega \pm 1\%$. Should be connected between RxA and RxB for internal bias.
P12	ICT	I	In-Circuit Test Input: Setting this pin "Low" causes all digital and analog outputs to go into a high-impedance state to allow for in-circuit testing. For normal operation, tie this pin "High". NOTE: This pin is internally pulled up.
R12	TEST	****	Factory Test Pin NOTE: This pin must be connected to GND for normal operation.

MICROPROCESSOR INTERFACE

LEAD #	SIGNAL NAME	TYPE	DESCRIPTION
K3	\overline{CS}	I	Chip Select Tie this "Low" to enable the communication with the Microprocessor Interface.
R1	PCLK	I	Processor Clock Input To operate the Microprocessor Interface, appropriate clock frequency is provided through this pin. Maximum frequency is 66 Mhz.
K2	\overline{WR}	I	Write Data : To write data into the registers, this active low signal is asserted.
L2	\overline{RD}	I	Read Data: To read data from the registers, this active low pin is asserted.
J3	RESET	I	Register Reset: Setting this input pin "Low" resets the contents of the Command Registers to their default settings and default operating configuration NOTE: This pin is internally pulled up.
L3	PMODE	I	Processor Mode Select: When this pin is tied "High", the microprocessor is operating in synchronous mode which means that clock must be applied to the PCLK (pin 55). Tie this pin "Low" to select the Asynchronous mode. An internal clock is provided for the microprocessor interface.

MICROPROCESSOR INTERFACE

LEAD #	SIGNAL NAME	TYPE	DESCRIPTION
T3	\overline{RDY}	O	Ready Acknowledge: <i>NOTE: This pin must be connected to VDD via 3 kΩ \pm 1% resistor.</i>
U3	\overline{INT}	O	INTERRUPT Output: A transition to "Low" indicates that an interrupt has been generated. The interrupt function can be disabled by clearing the interrupt enable bit in the Channel Control Register. NOTES: 1. This pin will remain asserted "Low" until the interrupt is serviced. 2. This pin must be connected to VDD via 3 k Ω \pm 1% resistor.
B4 A3 B3 C4 C3 C2 D3 D4	ADDR[0] ADDR[1] ADDR[2] ADDR[3] ADDR[4] ADDR[5] ADDR[6] ADDR[7]	I	ADDRESS BUS: 8 bit address bus for the microprocessor interface

FUNCTIONAL DESCRIPTION

The XRT75R06 is a six channel fully integrated Line Interface Unit featuring EXAR's R³ Technology (Reconfigurable, Relayless Redundancy) for E3/DS3/STS-1 applications. The LIU incorporates 6 independent Receivers, Transmitters and Jitter Attenuators in a single 217 Lead BGA package. Each channel can be independently programmed to support E3, DS-3 or STS-1 line rates using one input clock reference of 12.288MHz in Single Frequency Mode (SFM). The LIU is responsible for providing the physical connection between a line interface and an aggregate mapper or framing device. Along with the analog-to-digital processing, the LIU offers monitoring and diagnostic features to help optimize network design implementation. A key characteristic within the network topology is Automatic Protection Switching (APS).

EXAR's proven expertise in providing redundant solutions has paved the way for R³ Technology.

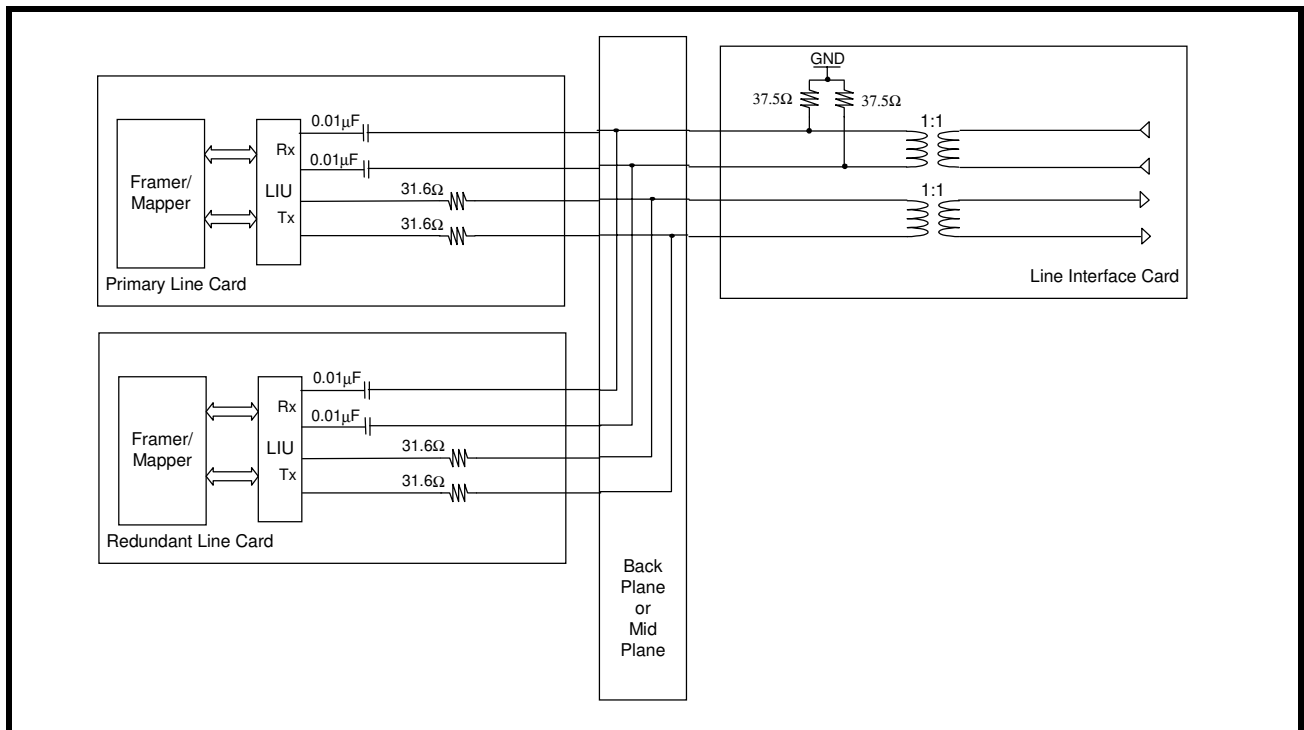

1.0 R³ TECHNOLOGY (RECONFIGURABLE, RELAYLESS REDUNDANCY)

Redundancy is used to introduce reliability and protection into network card design. The redundant card in many cases is an exact replicate of the primary card, such that when a failure occurs the network processor can automatically switch to the backup card. EXAR's R³ technology has re-defined E3/DS-3/STS-1 LIU design for 1:1 and 1+1 redundancy applications. Without relays and one Bill of Materials, EXAR offers multi-port, integrated LIU solutions to assist high density aggregate applications and framing requirements with reliability. The following section can be used as a reference for implementing R³ Technology with EXAR's world leading line interface units.

1.1 Network Architecture

A common network design that supports 1:1 or 1+1 redundancy consists of N primary cards along with N backup cards that connect into a mid-plane or back-plane architecture without transformers installed on the network cards. In addition to the network cards, the design has a line interface card with one source of transformers, connectors, and protection components that are common to both network cards. With this design, the bill of materials is reduced to the fewest amount of components. See Figure 3. for a simplified block diagram of a typical redundancy design.

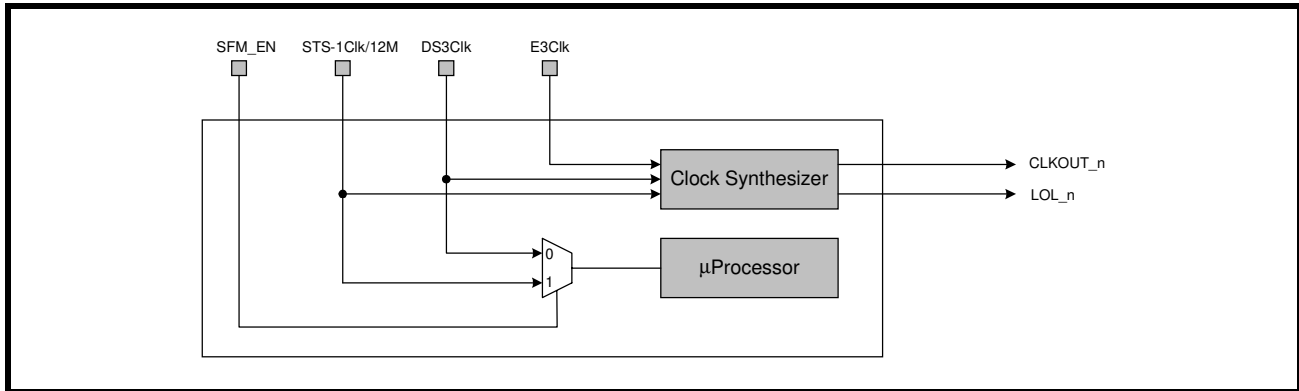

FIGURE 3. NETWORK REDUNDANCY ARCHITECTURE

2.0 CLOCK SYNTHESIZER

The LIU uses a flexible user interface for accepting clock references to generate the internal master clocks used to drive the LIU. The reference clock used to supply the microprocessor timing is generated from the DS-3 or SFM clock input. Therefore, if the chip is configured for STS-1 only or E3 only, then the DS-3 input pin must be connected to the STS-1 pin or E3 pin respectively. In DS-3 mode or when SFM is used, the STS-1 and E3 input pins can be left unconnected. If SFM is enabled by pulling the SFM_EN pin "High", 12.288MHz is the only clock reference necessary to generate DS-3, E3, or STS-1 line rates and the microprocessor timing. A simplified block diagram of the clock synthesizer is shown in Figure 4

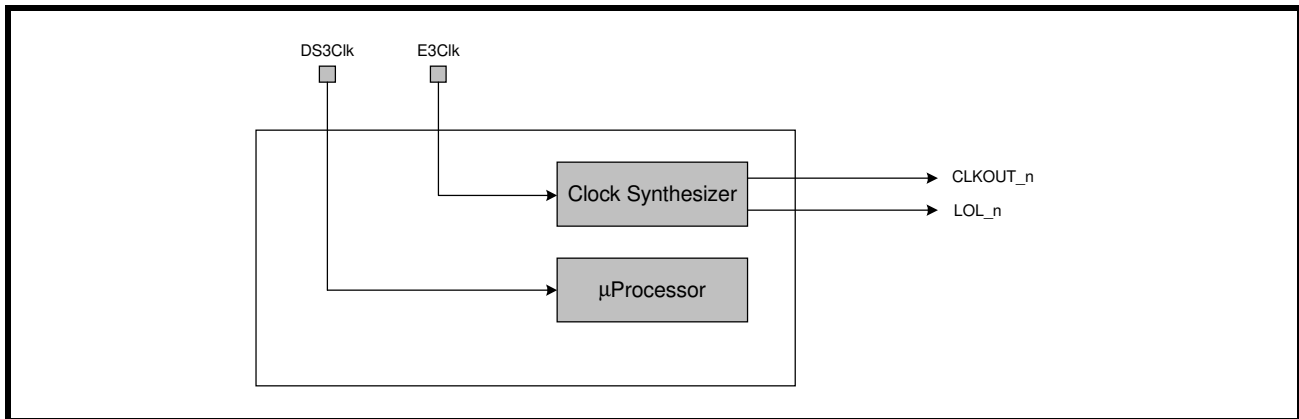

FIGURE 4. SIMPLIFIED BLOCK DIAGRAM OF THE INPUT CLOCK CIRCUITRY DRIVING THE MICROPROCESSOR

2.1 Clock Distribution

Network cards that are designed to support multiple line rates which are not configured for single frequency mode should ensure that a clock is applied to the DS3Clk input pin. For example: If the network card being supplied to an ISP requires E3 only, the DS-3 input clock reference is still necessary to provide read and write access to the internal microprocessor. Therefore, the E3 mode requires two input clock references. If however, multiple line rates will not be supported, i.e. E3 only, then the DS3Clk input pin may be hard wire connected to the E3Clk input pin.

FIGURE 5. CLOCK DISTRIBUTION CONFIGURED IN E3 MODE WITHOUT USING SFM

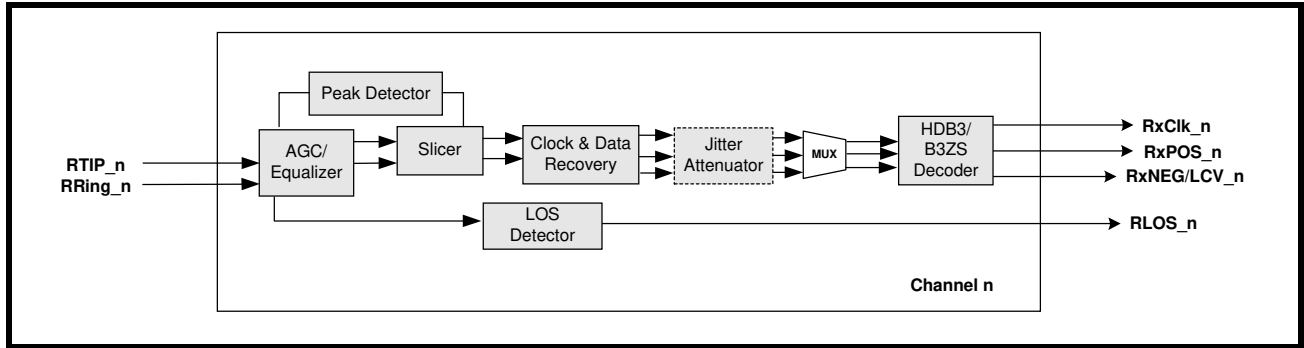

NOTE: For one input clock reference, the single frequency mode should be used.

3.0 THE RECEIVER SECTION

The receiver is designed so that the LIU can recover clock and data from an attenuated line signal caused by cable loss or flat loss according to industry specifications. Once data is recovered, it is processed and presented at the receiver outputs according to the format chosen to interface with a Framer/Mapper or ASIC. This section describes the detailed operation of various blocks within the receive path. A simplified block diagram of the receive path is shown in Figure 6.

FIGURE 6. RECEIVE PATH BLOCK DIAGRAM

3.1 Receive Line Interface

Physical Layer devices are AC coupled to a line interface through a 1:1 transformer. The transformer provides isolation and a level shift by blocking the DC offset of the incoming data stream. The typical medium for the line interface is a 75Ω coaxial cable. Whether using E3, DS-3 or STS-1, the LIU requires the same bill of materials, see Figure 7.

FIGURE 7. RECEIVE LINE INTERFACE CONNECTION

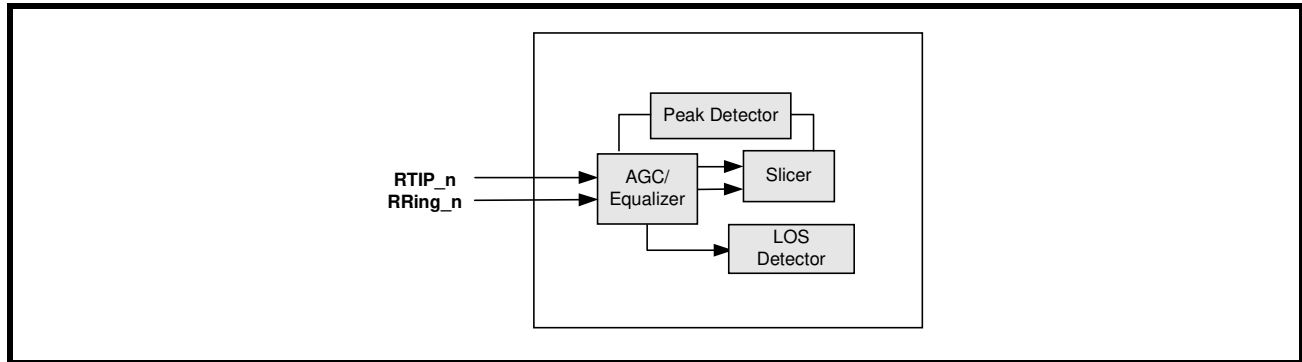

3.2 Adaptive Gain Control (AGC)

The Adaptive Gain Control circuit amplifies the incoming analog signal and compensates for the various flat losses and also for the loss at one-half symbol rate. The AGC has a dynamic range of 30 dB. The peak detector provides feedback to the equalizer before slicing occurs.

3.3 Receive Equalizer

The Equalizer restores the integrity of the signal and compensates for the frequency dependent attenuation of up to 900 feet of coaxial cable (1300 feet for E3). The Equalizer also boosts the high frequency content of the signal to reduce Inter-Symbol Interference (ISI) so that the slicer slices the signal at 50% of peak voltage to generate Positive and Negative data. The equalizer can be disabled by programming the appropriate register.

FIGURE 8. ACG/EQUALIZER BLOCK DIAGRAM

3.3.1 Recommendations for Equalizer Settings

The Equalizer has two gain settings to provide optimum equalization. In the case of normally shaped DS3/STS-1 pulses (pulses that meet the template requirements) that has been driven through 0 to 900 feet of cable, the Equalizer can be enabled. However, for square-shaped pulses such as E3 or for DS3/STS-1 high pulses (that does not meet the pulse template requirements), it is recommended that the Equalizer be disabled for cable length less than 300 feet. This would help to prevent over-equalization of the signal and thus optimize the performance in terms of better jitter transfer characteristics. The Equalizer also contains an additional 20 dB gain stage to provide the line monitoring capability of the resistively attenuated signals which may have 20dB flat loss. The equalizer gain mode can be enabled by programming the appropriate register.

NOTE: The results of extensive testing indicate that even when the Equalizer was enabled, regardless of the cable length, the integrity of the E3 signal was restored properly over 0 to 12 dB cable loss at Industrial Temperature.

3.4 Clock and Data Recovery

The Clock and Data Recovery Circuit extracts the embedded clock, RxClk_n from the sliced digital data stream and provides the retimed data to the B3ZS (HDB3) decoder. The Clock Recovery PLL can be in one of the following two modes:

3.4.1 Data/Clock Recovery Mode

In the presence of input line signals on the RTIP_n and RRing_n input pins and when the frequency difference between the recovered clock signal and the reference clock signal is less than 0.5%, the clock that is output on the RxClk_n out pins is the Recovered Clock signal.

3.4.2 Training Mode

In the absence of input signals at RTIP_n and RRing_n pins, or when the frequency difference between the recovered line clock signal and the reference clock applied on the ExClk_n input pins exceed 0.5%, a Loss of Lock condition is declared by toggling RLOL_n output pin “High” or setting the RLOL_n bit to “1” in the control register. Also, the clock output on the RxClk_n pins are the same as the reference channel clock.

3.5 LOS (Loss of Signal) Detector**3.5.1 DS3/STS-1 LOS Condition**

A Digital Loss of Signal (DLOS) condition occurs when a string of 175 ± 75 consecutive zeros occur on the line. When the DLOS condition occurs, the DLOS_n bit is set to "1" in the status control register. DLOS condition is cleared when the detected average pulse density is greater than 33% for 175 ± 75 pulses. Analog Loss of Signal (ALOS) condition occurs when the amplitude of the incoming line signal is below the threshold as shown in the Table 1. The status of the ALOS condition is reflected in the ALOS_n status control register. RLOS is the logical OR of the DLOS and ALOS states. When the RLOS condition occurs the RLOS_n output pin is toggled "High" and the RLOS_n bit is set to "1" in the status control register.

TABLE 1: THE ALOS (ANALOG LOS) DECLARATION AND CLEARANCE THRESHOLDS FOR A GIVEN SETTING OF LOSTHR AND REQEN (DS3 AND STS-1 APPLICATIONS)

APPLICATION	REQEN SETTING	LOSTHR SETTING	SIGNAL LEVEL TO DECLARE ALOS DEFECT	SIGNAL LEVEL TO CLEAR ALOS DEFECT
DS3	0	0	< 75mVpk	> 130mVpk
	1	0	< 45mVpk	> 60mVpk
	0	1	< 120mVpk	> 45mVpk
	1	1	< 55mVpk	> 180mVpk
STS-1	0	0	< 120mVpk	> 170mVpk
	1	0	< 50mVpk	> 75mVpk
	0	1	< 125mVpk	> 205mVpk
	1	1	< 55mVpk	> 90mVpk

3.5.2 Disabling ALOS/DLOS Detection

For debugging purposes it is useful to disable the ALOS and/or DLOS detection. Writing a "1" to both ALOSDIS_n and DLOSDIS_n bits disables the LOS detection on a per channel basis.

3.5.3 E3 LOS Condition:

If the level of incoming line signal drops below the threshold as described in the ITU-T G.775 standard, the LOS condition is detected. Loss of signal is defined as no transitions for 10 to 255 consecutive zeros. No transitions is defined as a signal level between 15 and 35 dB below the normal. This is illustrated in Figure 9. The LOS condition is cleared within 10 to 255 UI after restoration of the incoming line signal. Figure 10 shows the LOS declaration and clearance conditions.

FIGURE 9. LOSS OF SIGNAL DEFINITION FOR E3 AS PER ITU-T G.775

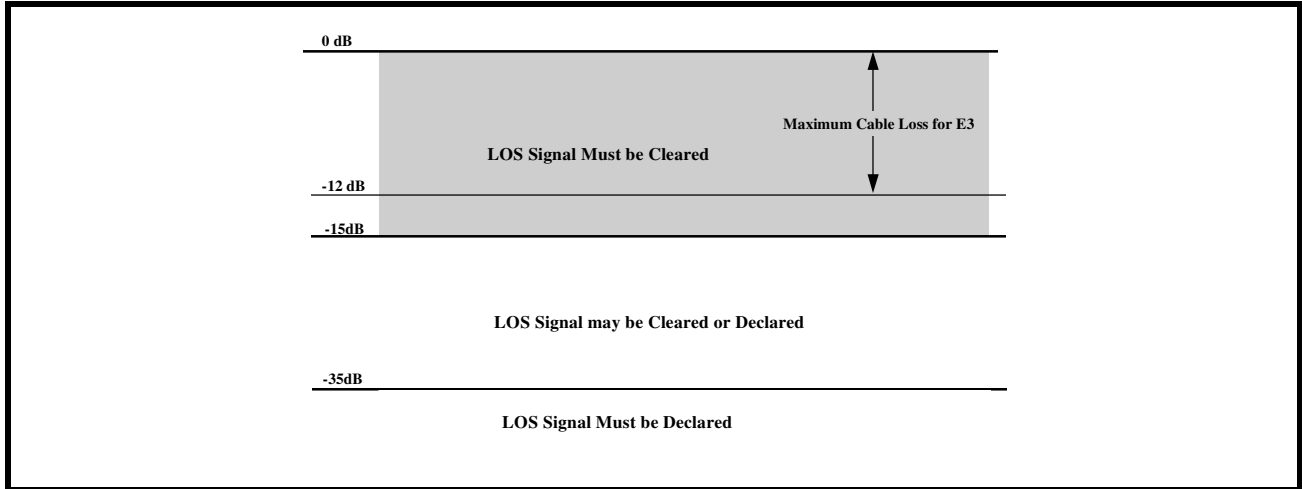

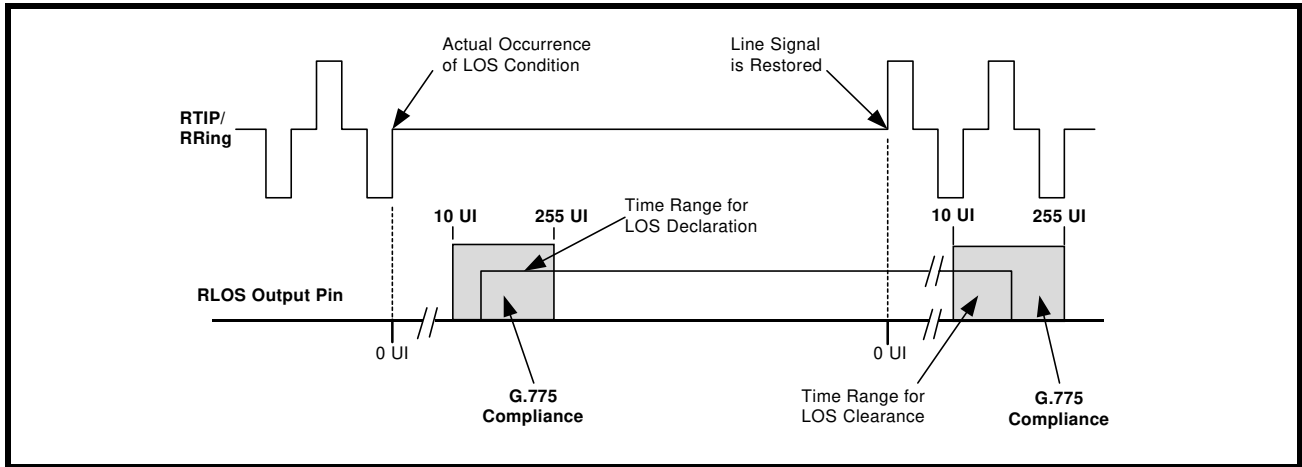

FIGURE 10. LOSS OF SIGNAL DEFINITION FOR E3 AS PER ITU-T G.775.

3.5.4 Interference Tolerance

For E3 mode, ITU-T G.703 Recommendation specifies that the receiver be able to recover error free clock and data in the presence of a sinusoidal interfering tone signal. For DS3 and STS-1 modes, the same recommendation is being used. Figure 11 shows the configuration to test the interference margin for DS3/STS1. Figure 12 shows the set up for E3.

FIGURE 11. INTERFERENCE MARGIN TEST SET UP FOR DS3/STS-1
