

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**Ultra High-Precision FRSM Wrap-Around Chip Resistors,
Z1 Foil Technology Configuration**
with TCR of ± 0.05 ppm/°C and
Improved Load-Life Stability of 0.0025% (25 ppm)

FEATURES

- Temperature coefficient of resistance (TCR):
 ± 0.05 ppm/°C typical (0°C to +60°C)
 ± 0.2 ppm/°C typical (-55°C to +125°C, +25°C ref.)
- Resistance tolerance: to $\pm 0.01\%$
- Power coefficient “ ΔR due to self heating”: 5 ppm at rated power
- Power rating: to 750 mW at +70°C
- **Load life stability:**
 $\pm 0.0025\%$ typical at 70°C, 2000 h at rated power
 $\pm 0.005\%$ typical at 70°C, 10,000 h at rated power
- Resistance range: 5 Ω to 125 k Ω (for higher and lower values, please contact us)
- Bulk Metal Foil resistors are not restricted to standard values; specific “as required” values can be supplied at no extra cost or delivery (e.g., 1K2345 vs. 1K)
- Thermal stabilization time: <1 s (nominal value achieved within 10 ppm of steady state value)
- Electrostatic discharge (ESD): at least to 25 kV
- Short time overload: $\leq 0.005\%$ typical
- Rise time: 1 ns, effectively no ringing
- Current noise: <0.010 $\mu V_{RMS}/V$ of applied voltage (<-40 dB)
- Voltage coefficient: <0.1 ppm/V (resistance values above 10 k Ω)
- Non-inductive: 0.08 μH
- Non-hot spot design
- Terminal finishes available: lead (Pb)-free, tin/lead alloy*
- Matched sets are available on request
- Screening in accordance with EEE-INST-002 and MIL-PRF-55342 available (see datasheet resistor models 303261 to 303266)
- Quick prototype quantities available, please contact us.

INTRODUCTION

The ultra high precision FRSM is based on the new generation Z1 Foil Technology of the Bulk Metal® Foil resistor elements by Vishay Foil Resistors (a VPG brand), which makes these resistors virtually insensitive to destabilizing factors (for more information about stresses and destabilizing factors please refer to Tech Note 102: www.vishaypg.com/doc?63135). Their element, based on

the Z1 Foil Technology is a solid alloy that displays the desirable bulk properties of its parent material; thus, it is inherently stable (remarkably improved load life stability of 25 ppm), noise-free and withstands ESD to 25 V or more. The alloy is matched to the substrate and forms a single entity with balanced temperature characteristics for an unusually low and predictable TCR over a wide range from -55°C to more than 175°C. Resistance patterns are photo-etched to permit trimming of resistance values to very tight tolerances.

Our application engineering department is available to advise and make recommendations. For non-standard technical requirements and special applications, please contact us using the e-mail address in the footer below.

Table 1 – Tolerance and TCR vs. Resistance Value

Resistance Value (Ω)	Tolerance (%)	Typical TCR and Spread (ppm/°C) ⁽¹⁾
250 to 125k	$\pm 0.01\%$	$\pm 0.05 \pm 0.5$
100 to <250	$\pm 0.02\%$	
50 to <100	$\pm 0.05\%$	
25 to <50	$\pm 0.1\%$	
10 to <25	$\pm 0.25\%$	
5 to <10	$\pm 0.5\%$	

⁽¹⁾ From 0°C to 60°C

* This datasheet provides information about parts that are RoHS-compliant and/or parts that are non-RoHS-compliant. For example, parts with lead (Pb) terminations are not RoHS compliant. Please see the information/tables in this datasheet for details.

ABOUT THE FRSM SERIES

Several factors need to be considered when choosing a resistor for applications that require long term stability, including TCR (ambient temperature), Power TCR (self heating), load-life stability for more than 10K hours (instead of the typical 1000 or 2000 hours load-life), end-of-life tolerance (which is more important than the initial tolerance), thermal EMF (low values, D.C), thermal stabilization and ESD. Some precision resistor technologies such as Precision Thin Film offer designers tight initial tolerances as low as 0.02 % but have poor load life stability, high end-of-life tolerance, long thermal stabilization, high drifts during operational life and ESD sensitivity. Other resistor technologies, such as Wirewounds, provide low absolute TCR and excellent current noise of -40 dB but have high inductance and poor rise time (or thermal lag) for more than a few seconds.

There are essentially only three resistance technologies widely used for precision resistors in military and space applications: Thin Film, Wirewound and Bulk Metal® Foil. Each has its own balance of characteristics and costs that justify its selection in these applications. Thin Films are most cost-efficient within their normal range of characteristics but have the highest TCR, highest noise and have the least stability of the three technologies. Wirewounds have low noise, low TCR and a high level of stability at moderate cost but also have high impedance and slow signal response. Wirewounds can also have a higher power density, but some stability is lost through temperature cycling and load-life when made in smaller configurations. Bulk Metal Foil resistors have the lowest noise, lowest TCR, highest stability and highest speed of any technology but may have a higher cost, depending upon model. With Bulk Metal Foil resistors, savvy designers often save overall by concentrating the circuit stability in the Bulk Metal Foil resistors where exceptional stability allows for use of less-costly active devices—an option not available with other resistor technologies because Bulk Metal Foil foil requires a smaller total error budget through all cumulative resistor life exposures. Also, Bulk Metal Foil often eliminates extra circuitry added merely for the purpose of correcting the limitations of other resistor components. FRSM Bulk Metal Foil resistors, based on new generation technology and improved production methods starting from February 2011, offer designers the complete set of top performance characteristics to simplify circuitry and lower overall system costs by reducing the number of required parts while assuring a better end product. The new series of FRSM feature a long-term load-life stability within 0.0025% after 2000 hours and 0.005% after 10000 hours under full rated power at +70°C, first time in the history of all resistor technologies. In addition to their low absolute TCR of almost zero TCR, the devices offer Power TCR (“ ΔR due to self heating”) to ± 5 ppm at rated power; tight tolerance from 0.01% and thermal EMF of 0.05 $\mu V/^\circ C$.

The causes of resistor drift are listed in Table 4 and the allowances shown are for full scale exposure. The designer may choose to use a percentage of full scale stress factor if the equipment will never see the full

scale conditions. For example, a laboratory instrument that is expected to be permanently installed in an air-conditioned laboratory does not need an end-of-life allowance for excessive heat. There are other reasons for tolerancing the resistors tighter than the initial calculation: Measurement equipment accuracy is traditionally ten times better than the expected accuracy of the devices under test. These tighter tolerance applications require a high precision resistor. Also, the drift of the resistor without any stress factor considerations results in a shift over time that must be considered. FRSMs have the least amount of time shift. The manufacturer’s recommended recalibration cycle is a factor in the saleability of the product and the longer the cycle, the more acceptable the product. Bulk Metal Foil resistors contribute significantly to the longer calibration cycle.

Figure 1 – Power Derating Curve

Figure 2 – Trimming to Values (conceptual illustration)

Note

To acquire a precision resistance value, the Bulk Metal® Foil chip is trimmed by selectively removing built-in “shorting bars.” To increase the resistance in known increments, marked areas are cut, producing progressively smaller increases in resistance. This method reduces the effect of “hot spots” and improves the long-term stability of Bulk Metal Foil resistors.

Figure 3—Typical Resistance/Temperature Curve⁽¹⁾

⁽¹⁾ The TCR values for < 100 Ω are influenced by the termination composition and result in deviation from this curve.

Figure 4—Recommended Mounting

1. IR and vapor phase reflow are recommended.
2. Avoid the use of cleaning agents that attack epoxy resins, which form part of the resistor construction.
3. Vacuum pick up is recommended for handling.
4. If the use of a soldering iron becomes necessary, precautionary measures should be taken to avoid any possible damage/overheating of the resistor.

* Recommendation: The solder fillet profile should be such as to avoid running over the top metallization.

Table 2—Specifications⁽¹⁾

Chip Size	Rated Power at +70°C (mW)	Max. Working Voltage ($\leq \sqrt{P \times R}$)	Resistance Range (Ω)	Typ. TCR and Spread, -55°C to +125°C, +25°C Ref. (ppm/°C)	Max. Weight (mg)

Moisture Resistance	±0.003% (30 ppm)	±0.01% (100 ppm)
Load Life Stability , +70°C for 2000 h at Rated Power, see Figure 8	0.0025% (25 ppm)	±0.005% (50 ppm)
Load Life Stability , +70°C for 10,000 h at Rated Power	±0.005% (50 ppm)	±0.015% (150 ppm)

⁽¹⁾ As shown +0.01 Ω to allow for measurement errors at low values.

PULSE TEST

Test Description and Results

All parts baked at +125°C for 1 hr and allowed to cool at room temperature for 1 hr, prior to testing. By using an electrolytic 0.01 μF capacitor charged to 1000 VDC, a single pulse was performed on 20 units of 1206, for each value: 100Ω, 1 KΩ and 10 KΩ of surface mount Bulk Metal® Foil resistor and thin film resistor. The unit was allowed time to cool down, after which the resistance measurement was taken and displayed in ppm deviation from the initial reading.

Figure 5—Pulse Test Description

Table 5—Pulse Test Results

Value	Voltage	T = RC	AVERAGE DEVIATION (%)	
			Bulk Metal Foil	Thin Film
100R	1000 VDC	1 μsec	<0.001	Open
1k		10 μsec		>35
10k		100 μsec		>0.008

Figure 6—Thermal Shock Test

ELECTROSTATIC DISCHARGE (ESD)

ESD can be categorized into three types of damages:

Parametric Failure occurs when the ESD event alters one or more device parameters (resistance in the case of resistors), causing it to shift from its required tolerance. This failure does not directly pertain to functionality; thus a parametric failure may be present while the device is still functional.

Catastrophic Damage occurs when the ESD event causes the device to immediately stop functioning. This may occur after one or a number of ESD events with diverse causes, such as human body discharge or the mere presence of an electrostatic field.

Latent Damage occurs when the ESD event causes moderate damage to the device, which is not noticeable, as the device appears to be functioning correctly. However, the load life of the device has been dramatically reduced, and further degradation caused by operating stresses may cause the device to fail during service. Latent damage is the source for greatest concern, because it is very difficult to detect by re-measurement or by visual inspection, since damage may have occurred under the external coating.

Test Description and Results

By using a electrolytic 500 pF capacitor charged up to 4500 V, pulses were performed on 10 units of 1206, 10 kΩ of three different Surface Mount Chip Resistors technologies, with an initial voltage spike of 2500 V (Figure 7). The unit was allowed time to cool down, after which the resistance measurement was taken and displayed in ppm deviation from the initial reading. Readings were then taken in 500 V increments up to 4500 V.

Figure 7 – ESD Test Description

Table 6 – ESD Test Results

Volts	ΔR (%)		
	Thick Film	Thin Film	Bulk Metal Foil
2500	-2.7	97	<0.005
3000	-4.2	366	
3500	-6.2	>5000	
4000	-7.4	>5000	
4500	-8.6	Open	

Figure 8 – Load Life Test for 2000 Hrs @ +70°C at Rated Power

POWER COEFFICIENT OF RESISTANCE (PCR)

In precision resistors with low TCR, the self heating (Joule effect) causes the resistor not to perform strictly to its TCR specifications. This inaccuracy will result in an error at the end in the resistance value under applied power. Vishay Foil Resistors introduced a new concept of Power Coefficient of Resistance (PCR) along with a new Z-Foil technology which leads to reduction of the sensitivity of precision resistor to ambient temperature variations and changes of applied power.

Figure 9 represents PCR behavior of three different resistor technologies under applied power.
