Note: 1. Obtained by setting an OMRON standard measurement object at the measurement center distance and determining the average height of the beam line. The conditions are given in the table below. However, satisfactory resolution cannot be attained in strong electromagnetic fields. The minimum resolution of the ZG2-WDS8T/WDS3VT is 0.25 μm, even when the average number of operations is increased. Resolution does not go any lower.

Model	CCD Mode	Average No. of Operations	Measurement object	
			Regular reflective	Diffuse reflective
ZG2-WDS8T/ ZG2-WDS22/ ZG2-WDS70	High-precision mode	64	OMRON standard white alumina ceramic object	
ZG2-WDS3T			OMRON standard mirrored object	OMRON standard diffuse reflective object

2. The tolerance for an ideal straight line obtained by determining the average height of an OMRON standard measurement object for the beam line. The CCD high-resolution mode is used. Linearity varies depending on the measurement object.

Model	Measurement object	
	Regular reflective	Diffuse reflective
ZG2-WDS8T/ WDS22/WDS70	OMRON standard white alumina ceramic object	
ZG-WDS3T	OMRON standard mirrored object	OMRON standard diffuse reflective object

3. A value attained by using an aluminum jig to secure the distance between the Sensor Head and the measurement object. The CCD standard mode is used.

4. Defined as 1/e<sup>2</sup> (13.5%) of the center light intensity. This may be influenced when light leakage also exists outside the defined area and the reflectivity of the light around the measurement object is higher than that of measurement object.
