

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# ZL30240 Dual Channel Precision Universal Clock Generator and NCO

## Ordering Information

ZL30240LDG1 48 Pin QFN Tray  
 ZL30240LDF1 48 Pin QFN Tape/Reel  
 Matte Tin  
**-40°C to +85°C**  
 Package size: 7 x 7 mm

## Features

### PLL

- Two independently programmable PLLs with ultra low jitter
- Supports integer, fractional and ratio modes
  - Ratio mode for flexible FEC rate support

### Inputs

- Crystals, crystal oscillator or reference (singled ended or differential) inputs
  - Crystal Input range from 22 MHz to 54 MHz
  - Crystal oscillator or single-ended reference input from 22 MHz to 180 MHz
  - Differential reference input from 22 to 864 MHz

### Configuration

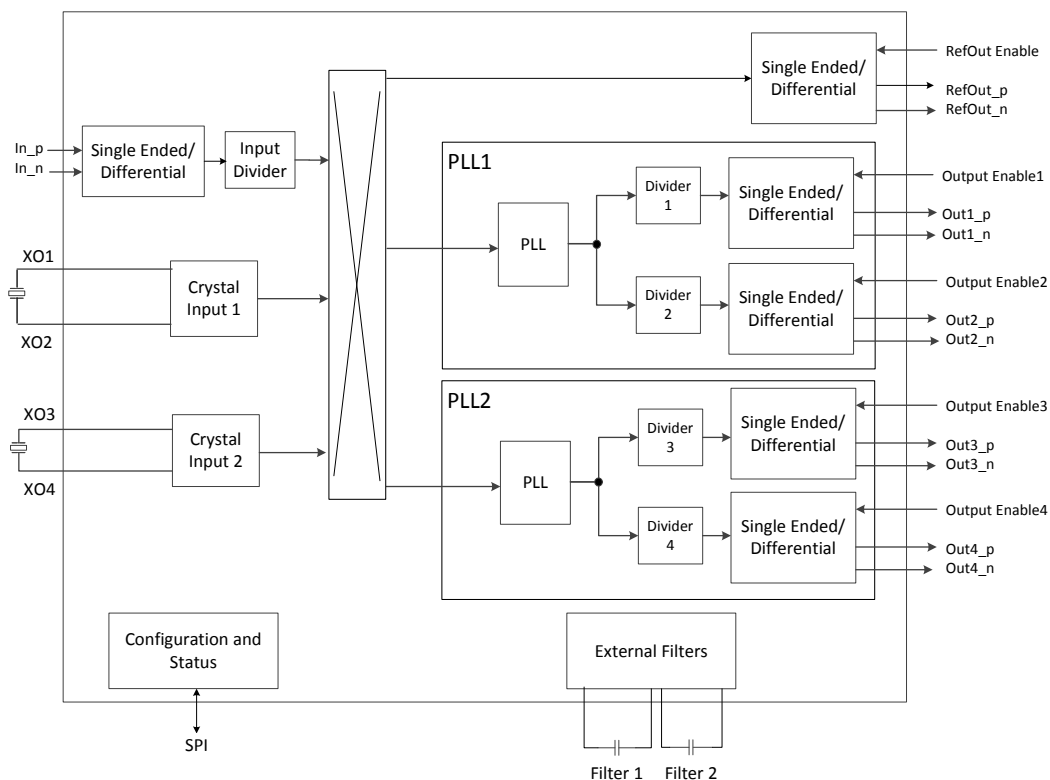

- Generates clock signals at power-up per user defined custom configuration (factory programmable)
- Dynamically configurable via SPI and volatile configuration registers

## Outputs

- Synthesizes four different frequencies simultaneously from two different PLLs
  - Up to 275 fs RMS jitter for integer mode
  - Up to 400 fs RMS jitter for fractional mode
- Each output is independently configurable to support LVDS, LVPECL, HCSL, LVCMOS
- Generates any output frequency from 12 MHz – 914 MHz
- Generates output from either crystals, a crystal oscillator or reference
- NCO accuracy less than 0.1 ppb in fractional mode

## Applications

- Clocks for NPUs, FPGAs, 10G CDRs, high-speed ADC, PCIe interface devices, Ethernet switches and PHYs
- Timing for optical, storage, networking and broadcast video applications

## 2.0 Pin Description

Pin Name	48 QFN Pin #	Name	Type	Description
In_p In_n	42 41	Input	INPUT Selectable	Input (singled ended or differential). Can be selected as the reference clock for PLL1, PLL2, and/or the Reference Clock Output. When not used for a single ended crystal oscillator, it can be differential with a DC bias provided by the In_VCM pin.
In_VCM	40	Input Bias	DC	When In_p/In_n act as a differential input, this pin connects to the midpoint of the two 50 ohm internal termination resistors.
XO1 XO2	39 38	Crystal Input 1	INPUT	External Crystal should be connected to these pins to drive the internal oscillator reference. This input can be used as the reference for PLL1, PLL2 and/or the Reference Clock Output.
XO3 XO4	46 45	Crystal Input 2	INPUT	External Crystal should be connected to these pins to drive the internal oscillator reference. This input can be used as the reference for PLL1, PLL2 and/or the Reference Clock Output.

Table 1 - Pin Description

Pin Name	48 QFN Pin #	Name	Type	Description
OUT1_p OUT1_n	2 3	Clock Output 1	OUTPUT Selectable <sup>1</sup>	Clock Output derived from PLL1. Supports frequencies up to the device maximum. When used in LVCMOS mode, OUT1_p is the active pin and OUT1_n is not used and is High-Z.
OE1	15	Output Enable 1	INPUT LVCMOS	Output Enable for Clock Output 1. Active High, When the output is disabled, it places OUT1_p & OUT1_n into High-Z state. This pin is internally pulled-up to VDD through 75 kohms.
OUT2_p OUT2_n	7 8	Clock Output 2	OUTPUT Selectable <sup>1</sup>	Clock Output derived from PLL1. Supports frequencies up to the device maximum. When used in LVCMOS mode, OUT2_p is the active pin. OUT2_n is not used and is High-Z.
OE2	16	Output Enable 2	INPUT LVCMOS	Output Enable for Clock Output 2. Active High, When the output is disabled, it places OUT2_p & OUT2_n into High-Z state. This pin is internally pulled-up to VDD through 75 kohms.
OUT3_p OUT3_n	29 28	Clock Output 3	OUTPUT Selectable <sup>1</sup>	Clock Output derived from PLL2. Supports frequencies up to the device maximum. When used in LVCMOS mode, OUT3_p is the active pin and OUT3_n is not used and is High-Z.
OE3	21	Output Enable 3	INPUT LVCOMS	Output Enable for Clock Output 3. Active High, When the output is disabled, it places OUT3_p & OUT3_n into High-Z state. This pin is internally pulled-up to VDD through 75 kohms.
OUT4_p OUT4_n	34 33	Clock Output 4	OUTPUT Selectable <sup>1</sup>	Clock Output derived from PLL2. Supports frequencies up to the device maximum. When used in LVCMOS mode, OUT4_p is the active pin and OUT4_n is not used and is High-Z.
OE4	22	Output Enable 4	INPUT LVCMOS	Output Enable for Clock Output 4. Active High, When the output is disabled, it places OUT4_p & OUT4_n into High-Z state. This pin is internally pulled-up to VDD through 75 kohms.
RefOut_p RefOut_n	44 43	Reference Output	OUTPUT Selectable <sup>1</sup>	Reference Clock Output. Provides a copy of the Reference Input (or Crystal input) frequency.

### 3.0 Description

The ZL30240 is a dual PLL clock generator with four programmable outputs. Two PLLs, each with either a crystal, crystal oscillator or external reference input frequency, produce up to four unique output frequencies. Each output can select between LVCMOS, LVDS, LVPECL, and HCSL. The input crystal is a low cost fundamental mode type, and the ZL30240 provides programmable gain and load capacitors for the crystal inputs. Alternatively, a multi-standard input reference can be used for either or both PLLs with a dedicated divider. The crystal or external reference frequency are also available as an output bypassing the PLLs for test purposes.

The PLLs operate independently, but may share the input reference. Three modes of operation can be selected: integer mode, fractional mode, and ratio mode. The integer mode provides lowest noise, and behaves like a conventional PLL with whole number dividers. This device will get integer mode performance even with 3 fractional bits in use allowing eighths in the feedback divider without increasing the jitter. The fractional mode allows the feedback divider to have an 8 bit integer part and 28 bit fractional part, resulting in a frequency resolution of 0.1 ppb or better. Finally, the ratio mode offers frequency translation of an  $N + X/Y$  nature for frequency translation applications like SONET and OTN.

The PLLs have VCOs that operate between 3053 MHz and 3677 MHz. There are two output dividers on each PLL, with a range of 4 to 259. In order to prevent a “frequency hole” between 750.6 MHz and 777.5 MHz, a special divide by 4.5 mode is also included. Any output frequency between 12 MHz and 914 MHz can be produced on the differential output.

Additional features include loss of lock indicators and high speed SPI control. The ZL30240 has factory programmed defaults and may also be reconfigured through the SPI port.

### 3.1 Input Configuration

The In\_p/In\_n pins can take one of four modes.

Refmode [1:0]	Mode
00	LVCMOS
01	LVDS
10	LVPECL
11	HCSL

**Table 2 - Input modes**

For LVCMOS mode, the external components are shown in Figure 2.

**Figure 2 - Input Termination - LVCMOS**

For LVDS mode, the external components are shown in Figure 3.

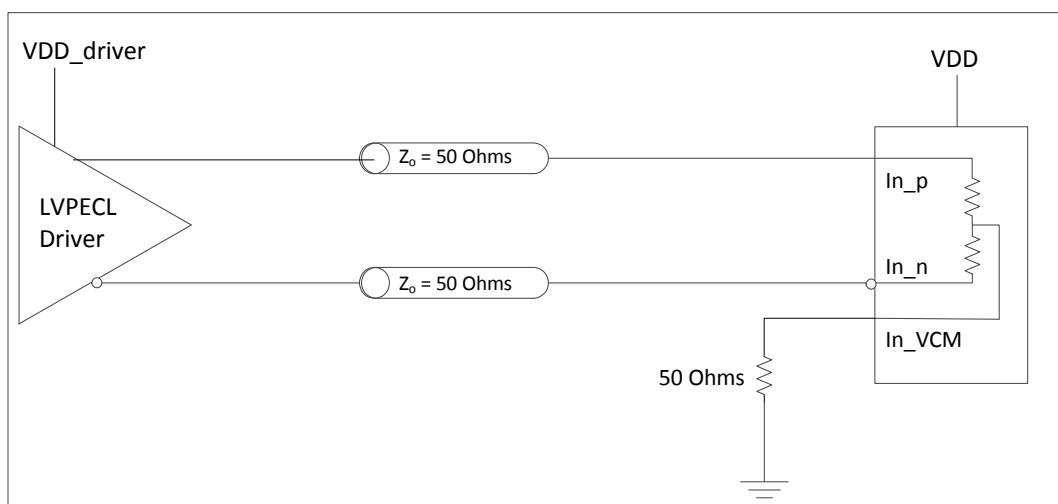

**Figure 3 - Input Termination - LVDS**

For LVPECL mode, the external components are shown in Figure 4 for AC coupled and Figure 5 for DC coupled.

**Figure 4 - Input Termination - LVPECL AC coupled**

**Figure 5 - Input Termination - LVPECL DC coupled**

For HCSL mode, the external components are shown in Figure 6.

**Figure 6 - Input Termination - HCSL**

### 3.2 Output Configuration

There are five separate output buffers on the ZL30240. Each for the two PLLs has two outputs. The input frequency can also bypass the PLLs to an additional output buffer. All five buffers can be configured for LVCMOS, LVDS, LVPECL or HCSL. Each output has an output enable pin (OE), and each output may be enabled or disabled from this pin or a bit in the register set. For each output, the modes are defined in Table 3.

OutnMode [1:0]	Mode
00	LVCMOS
01	LVDS
10	LVPECL

11	HCSL
----	------

Table 3 - Output modes

Each output is by default enabled or disabled by a logical AND of the OEn hardware pin value accessible in register 0x2 and one SPI bit. The logical behavior of all relevant bits are shown in Figure 7.

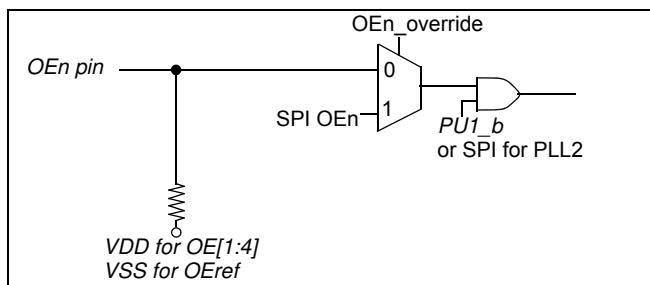

Figure 7 - Output Enable/Disable

### 3.2.1 Output Control Pins

The outputs are controlled by either a hardware OE pin or a OE register based on the value in the override bit in the register. The default values of the override bits are zeros, so the hardware pins control the outputs. When the hardware pin is enabled, the OEn SPI bit is read-only showing the current state of the related hardware pin.

The OE1, OE2, OE3 and OE4 pins have 75 k $\Omega$  pull-up resistors, while the Oeref pin has a 50 k $\Omega$  pull-down resistor.

To disable the hardware pin control, the associated override bit can be set in SPI register 0x2. When the 'override' bit is set to '1', the external OE pin is ignored, and its value is no longer passed into register 0x2. Instead the value of the OEn bit in register 0x2 is used in its place, and can be set through the SPI. Under this configuration, both the override bit and OEn bit in register 0x2 must be set to '1' to enable the output.

When an output changes from disabled to enabled, there is an approximately 2 microsecond delay before it begins switching. During this delay, the outputs will settle to the appropriate DC levels according to the configured mode. After this initial delay, the outputs will begin switching with precise periods and no 'runt' pulses.

When an output changes from enabled to disabled, it will stop switching at the appropriate DC levels according to the configured mode. After it has stopped, the biases will be disabled and the output will be set to high impedance.

### 3.2.2 Output Electrical Format - (LVCMOS, LVDS, LVPECL, or HCSL)

The output format (mode) may be factory programmed and the output will operate in that mode at every power-up. In addition, the mode may be changed by writing the new value into register 0x4 via the SPI. Although all five output buffers are independent, the enables and modes may be programmed simultaneously.

Note that all of the output modes are differential except the LVCMOS mode. When LVCMOS is selected, the positive output pin has the LVCMOS signal, and the negative (inverting) output pin is high impedance. In LVCMOS mode, the output should be series terminated, or unterminated. Series termination consists of a 33 ohm resistor placed within 0.25 inches of the ZL30240 package. A 50 ohm transmission line driven with such a series termination will have reflections absorbed.

### 3.3 Reference Input

Two input references are available for the PLLs; a crystal oscillator which accepts standard crystals from 22 MHz to 54 MHz, and an external reference that may be supplied as a differential or single ended signal, and optionally, prescaled. Either reference may be utilized by either PLL through the internal selectors. Likewise, either reference may be selected for an optional output buffer that supports LVCMOS, LVDS, LVPECL or HCSL. Each PLL can select its input independently.

Register 0x2 contains the reference select control bits. Register 0x3 contains the configuration bits for the input reference buffer, prescaler, and reference output.

Three device pins are associated with the input signal: In\_p, In\_n and In\_VCM. For differential signals, In\_p and In\_n are the signal and In\_VCM is the terminating voltage. A LVCMOS single ended signal needs to be applied to In\_p only. The input signal then goes through a reference divider.

Note that the noise properties of the PLL reference matter a great deal to the output noise. At offset frequencies below the PLL loop bandwidth, the PLL tracks and multiplies the reference phase noise. The crystal input offers a very low phase noise reference, ensuring the output phase noise near the carrier is low. When selecting the input reference, ensure the phase noise of the source is adequately low to meet the system noise requirements.

The reference divider is programmed via the `refdiv[3:0]` value in register 0x3; it divides by N+1 for a range of 1 to 16.

The `In_p/In_n` pins will accept LVCMOS, LVDS, LVPECL or HCSL signals. The register 0x3 bit 17, `diff_ref_sel` must be set to 0 to select LVCMOS, and 1 for any differential signal. When LVCMOS is selected, it is applied to `In_p`.

<code>diff_ref_sel</code>	Reference_signal
0	LVCMOS
1	differential ( LVDS, LVPECL or HCSL)

**Table 4 - Reference Input (`In_p/In_n`) Selection**

The `RefOut_p/RefOut_n` pins may be used to buffer the prescaled input signal or crystal oscillator. Like the other outputs, it may be set to LVPECL, LVDS, HCSL, or LVCMOS formats. Register 0x3, bit 19, is the `refmux_sel`, which determines if the reference input signal or the crystal oscillator is provided on `RefOut_p/RefOut_n`.

### 3.4 Crystal Oscillator

The quartz crystal inputs (`XO1/XO2` and `XO3/XO4`) accept standard 8-12pf AT cut crystals from 22 MHz to 54 MHz. Since the negative resistance required for such a spread of crystals varies considerably, a programmable gain is provided. Microsemi recommends the use of a gain of 5 or above to help ensure start-up in all conditions to aid in trimming the crystal, programmable on-chip load capacitors are available.

In general, for lowest phase noise, the highest frequency crystal, compatible with the applications cost and other requirements, should be used. If integer modes of PLL operation are possible, the crystal should be selected so that the multiplication is an integer value for lowest noise.

The gain of the crystal oscillator is set via 3 bits. Register 0x4, bit 15 is `xtal_ftrim`; set this bit if the crystal is 33 MHz or lower. `Xtal_gain[2:0]` are found in register 0x4, bits 10:8. The values in this register depend on the crystal load caps, ESR, and frequency value. Recommendations are given below. The `xtal_gain` should be the minimum value that insures startup at maximum temperature for the maximum ESR value of the crystal.

Crystal Frequency (MHz)	ESR=25	ESR=35	ESR=45	<code>xtal=ftrim</code>
22	0	1	3	1
27	1	2	4	1
33	2	3	5	1
34	1	2	3	0
39	2	3	4	0
44	3	4	5	0
49	4	5	6	0
54	5	6	7	0

**Table 5 - `Xtal_gain[2:0]` Values**

Crystal load capacitors should be on the PCB and the on-chip load capacitors can then be used to trim for component variation. Register 0x4, bits 14:12, `xtal_cap[2:0]` set the on-chip load capacitance. The value in `xtal_cap` can then be used to optimize the load. It is also acceptable to set `xtal_cap` to 0, and trim the crystal load with the PCB capacitors only.

### 3.5 PLLs

The two PLLs in the ZL30240 operate independently. Each PLL consists of an input reference frequency (which may be shared), a phase/frequency detector, loop filter, VCO, feedback divider, and two output dividers. The feedback divider can operate in three distinct modes: integer, fractional and ratio.

- The integer mode behaves like a traditional integer value PLL, where the feedback divisor is an integer. Due to the internal structure of this PLL, values divisible for 1/8 will give the same high performance as integer values.
- The fractional mode allows the feedback divider to take on a value of the form  $Q_m.n$ , where  $m$  (the integer part) is 8 bits and  $n$  (the fractional part) is 28 bits.
- The ratio mode would typically be used for FEC (Forward Error Correction) rate translation. The feedback divider will take on values of the form  $A + (1/8)(B + C/D)$ . In this mode, the  $C$  and  $D$  have 16 bit resolution.

For all modes, the relation of the input frequency ( $f_{in}$ ), output frequency ( $f_{out}$ ), feedback divider ( $fbdiv$ ) and output divider ( $outdiv$ ) is:

$$f_{out} = \frac{fbdiv \times f_{in}}{outdiv}$$

The VCO frequency is ( $f_{out} * outdiv$ ).

#### 3.5.1 Integer Mode

Integer mode will provide the lowest possible phase noise. To operate in this mode, set  $S=0$  in register 0x7 (PLL1) or 9 (PLL2). The integer part of the feedback value is placed in  $divval[35:28]$  in register 0x6 (PLL1) and register 0x8 (PLL2). Since the integer mode can take multiples of 1/8 without a degradation in phase noise, three more fractional bits may be programmed in  $divval[27:25]$ , and still operate with high integer-like performance without adding modulator noise ( $M=0$ ). In Q notation, Q8.3 numbers may be entered in  $divval[35:25]$  in integer mode. The remainder of the bits in  $divval$  should be set to 0.

#### 3.5.2 Fractional Mode

The fractional mode allows Q8.28 numbers to be placed in  $divval$ . In fractional mode,  $M$  must be set to 2 or the PLL will ignore the lower 25 fractional bits.  $S$  should be set to 0 to use all fractional mode bits in this mode.

#### 3.5.3 Ratio Mode

The ratio mode is needed when frequency translation is required. This mode is triggered by setting the `rational_mode` bit to 1 in register 0x7 or 9 (bit 10) and setting  $M=2$ . It is recommended that  $S=0$  in this mode.

The format of the feedback divider equation will change depending on the value of  $S$ . With the recommended  $S$  value of 0, it will have the form of  $A + (1/8)(B + C/D)$ .  $A$  is put in  $divval[35:28]$  while  $B$  is placed in  $divval[27:25]$ .  $C$  is placed in  $divval[24:9]$  and the  $modulus[15:0]$  bits hold  $D$ .  $B$  may be 0 to 7.  $C$  and  $D$  are 16 bit values, where  $D$  must be greater than  $C$ .

Note that the modulus value is split with  $modulus[15:6]$  and  $modulus[5:0]$  which are found in different registers. For PLL1,  $modulus[5:0]$  is in register 0x6 (bits 9:4) and  $modulus[15:6]$  in register 0x7 (bits 9:0). For PLL2,  $modulus[5:0]$  is in register 0x8 (bits 9:4) and  $modulus[15:6]$  in register 0x9 (bits 9:0).

Other values of  $S$  will product the feedback divider values in Table 6.

Value of S	Divider Value
0	$A + (1/8)(B + C/D)$
1	$A + (1/4)(B + C/D)$
2	$A + (1/2)(B + C/D)$
3	$A + C/D$

**Table 6 - Interpretation of S Parameter in Ratio Mode**

### 3.6 Output Dividers

The VCO output is divided down to the required output frequency; there is one divider per output. The output dividers are found in register 5.

As a special case, for frequencies between 750 MHz and 778 MHz which cannot be accessed with divider of 4 or 5, a divider of 4.5 is provided. To divide by 4.5, set the `outn_4p5`. When this bit is set, the associated output divider will ignore the value in register 5 and divide by 4.5.

When the two PLLs are locked to the same output frequency, the phase of either output may be advanced or declined by 1/8 of the VCO period. Write a 1 to advance (register 7 or 9, bit 15), or decline (register 7 or 9, bit 11) to achieve a 1/8 VCO period change. When the two PLLs output the same frequency, this causes the relative phases to change. (The relative phases may be zeroed by the phase align bit in register 2.) The advance and decline phase operations work correctly even if the two PLLs operate at different frequencies.

In any case that the change to the feedback divider is small, i.e., a change in phase or a few ppm in frequency, the output frequencies will change smoothly with no sudden phase step. The change in the feedback divider will be instantaneous, but the VCO response will be smoothed by the loop filter. Thus any changes small enough not to cause lock disturbance will be smooth and continuous.

### 3.7 Status Indicators

The lock status of a PLL may be monitored via the `pll_x_lock` bit in register 15, bit 21 or 23. A value of 1 indicates lock, and is the normal condition. A 0 indicates out of lock, or the absence of a reference (either input signal or crystal).

### 3.8 Resets

The ZL30240 does not need a reset after power is applied, but some other configuration changes require a reset of the associated subsystem in the device. If the feedback divisor (`fbdiv`), `M`, or `S` value is changed in a PLL, then the corresponding `fbdiv_rese` (register 0x7 or 0x9 bit 14) bit needs to be toggled. If the output divisor (register 0x5) value is changed, the either `output1_2_rese` (register 0x7, bit 13) or `output3_4_rese` (register 0x9, bit 13) needs to be toggled.

## 4.0 SPI Programming

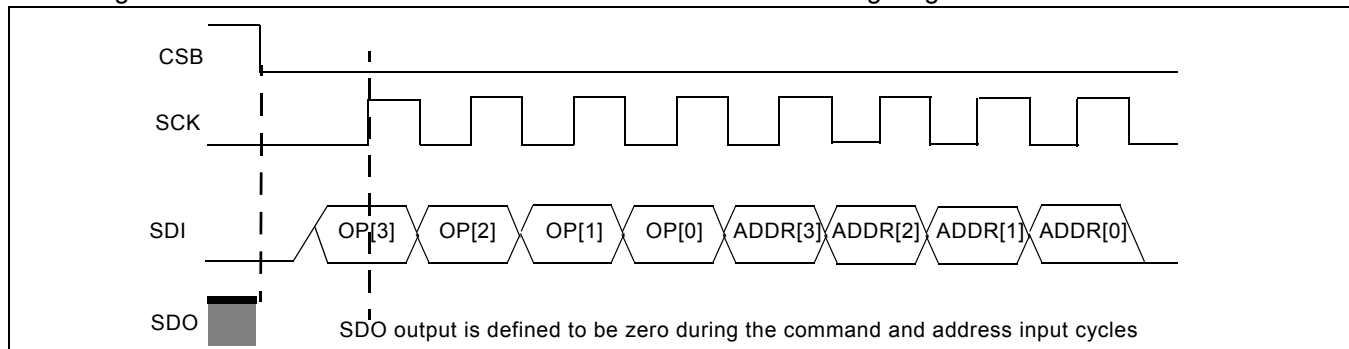

At power up, the ZL30240 takes on the values programmed by the factory. Thereafter, the SPI may be used to overwrite any value. Care should be taken not to overwrite the factory-programmed calibrations (registers 10 through 14). The maximum SPI clock rate is 10 MHz. All transfers are multiples of 8-bit bytes, and are read and written with most significant byte first, and most significant bit first.

### Serial Peripheral Interface Description

1. SCK is the clock input to the SPI interface.
2. SDI is the data input to the SPI interface. Data must be valid by the rising edge of SCK.
3. SDO is the data output from the SPI interface. Data at SDO will be valid after the rising edge of the clock.
4. CSB is the active-low enable signal for the SPI. The rising edge of CSB disables the SPI controller on the slave device. In the disabled state, the SPI controller will not respond to events on SCK or SDI, and SDO is in a high-impedance state. The falling edge of CSB enables the SPI for read/write access, and resets it to the initial state (awaiting the control/address byte). Register contents are not reset or otherwise altered by cycling CSB.
5. Multiple SPI slave devices may communicate with the same SPI master by sharing SDO, SDI, and SCK, and addressing each device with its individual CSB signal.
6. Upon power-up, all SPI read/write register contents are set to default values.

7. The SPI master initiates a data transfer by dropping CSB to enable the slave device, followed by eight bits of data applied synchronously with eight pulses of SCK. The first four bits define the opcode, and the last four bits define the register to be addressed. The data stream is shown in the following diagram:

**Figure 8 - Example SPI Read**

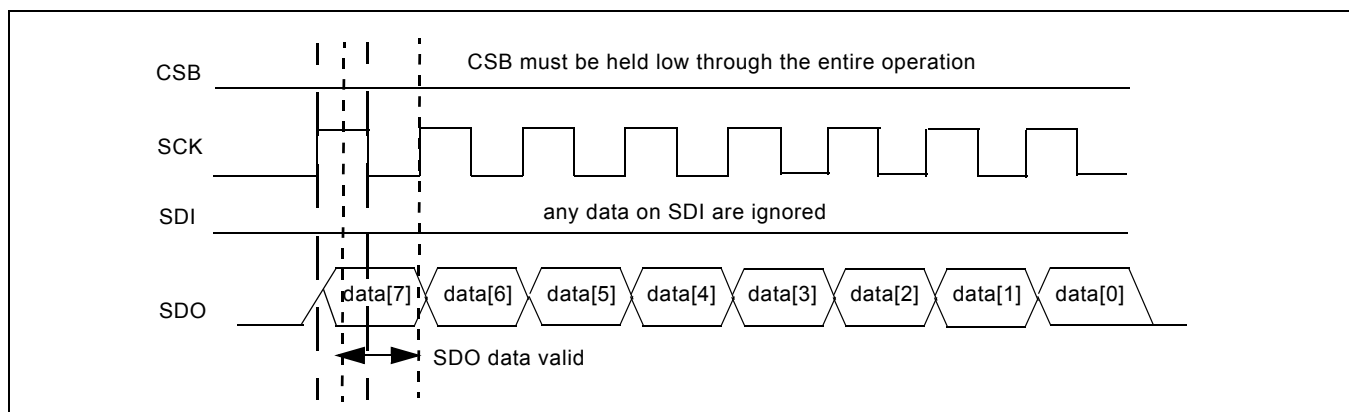

The register addresses ADDR[3:0] define an address space for up to 16 registers. The following four opcodes are defined by the interface:

OP[3:0]	Operation
0000	no-op
0001	write data
0010	read data
0011	reserved

**Table 7 - SPI Operation Codes**

The default state for CSB high is opcode zero, or no-op. The “read” opcodes are followed by one or more series of eight SCK pulses. Data from the register addressed by ADDR are placed on SDO, msb first. The number of eight-pulse cycles is determined by the type of register defined at address ADDR. The “write” opcodes are followed by one or more series of eight SCK pulses, with data to be written to the addressed register placed on SDI and valid at the rising edge of SCK.

The core circuits of the chip see the new contents of each byte on the falling edge of the eighth SCK pulse, with the exception of registers 6 and 8, all bits of which are updated simultaneously on the falling edge of the eighth SCK pulse of the last (5th) byte.

**Figure 9 - Read (opcode 2) cycle**

Figure 10 - Write (opcode 1) cycle

## 5.0 Register Map

The device is controlled by accessing registers through the SPI interface.

Reg_Addr (Hex)	Size (Bytes)	Register Name	Default Value (Hex)	Description	Type
<b>Miscellaneous Registers</b>					
0x0	4	Chip_id	0x03100000	Chip Identification	R
0x1	6	Product_id	0x7AF000000000	Product Identification	R
0x2	3	Device_config1	0x00AA0A	External pin read back and override	R/W
0x3	4	Device_config2	0x100F0000	Reference buffer/divider, interpolated value increment, and miscellaneous	R/W
0x4	2	Buffer_config	0x0000	Input and output buffer configuration	R/W
0x5	4	Output_divider	0x00000000	Control the value of the output dividers	R/W
0x6	5	PLL1_config1	0x000000000E	Control the value of the feed-back divider in PLL1	R/W
0x7	5	PLL1_config2	0x0000000000	Control PLL1 parameters	R/W
0x8	5	PLL2_config1	0x000000000E	Control the value of the feed-back divider in PLL2	R/W
0x9	5	PLL2_config2	0x0000000000	Control PLL2 parameters	R/W
0xA	2	Crystal2_config	0x0000	Configuration the parameters for the second crystal input 2 block (XO3/XO4)	R/W
0xB	4	Reserved	-	Reserved	-
0xC	4	PLL1_band	0x00000000	Control the PLL1 band	R/W
0xD	4	Reserved	-	Reserved	-
0xE	4	PLL2_band	0x00000000	Control the PLL2 band	R/W
0xF	3	PLL_lock	0x060000	Determine if either PLL is locked	R

**Table 8 - Register Map**

## 6.0 Detailed Register Map

Register_Address: <b>0x0</b> Register Name: <b>Chip_id</b> Default Value: <b>0x03100000</b> Type: <b>R</b>		
Bit Field	Function Name	Description
31:16	Chip_id[15:0]	For ZL30240, chip_id = 0x0310
15:0	Reserved	Leave as default

Register_Address: <b>0x1</b> Register Name: <b>Product_id</b> Default Value: <b>7AF000000000</b> Type: <b>R</b>		
Bit Field	Function Name	Description
31:0	Product_id[31:0]	Common value for all ZL3024x products

Register_Address: <b>0x2</b> Register Name: <b>Device_config1</b> Default Value: <b>0x00AA0A</b> Type: <b>R/W</b>		
Bit Field	Function Name	Description
23:20	Reserved	Leave as default
19	PhaseAlign	Toggle this bit to 1 to align the phases of the two PLLs. Note: A phase hit may result on the output.
18	PhaseAlign_enable	If this bit is 0, the PhaseAlign function will be disabled. If this bit is 1, the PhaseAlign function will be enabled and controlled by PhaseAlign (bit 19).
17	OERef	Output enable for the reference output
16	OERef_override	If this bit is 0, the reference output is controlled by the OERef pin. If this bit is 1, the reference output is controlled by bit 17.
15	OE4	Output 4 enable
14	OE4_override	If this bit is 0, output 4 is controlled by the OE4 pin. If this bit is 1, output 4 is controlled by bit 15.

Register_Address: <b>0x2</b> Register Name: <b>Device_config1</b> Default Value: <b>0x00AA0A</b> Type: <b>R/W</b>		
Bit Field	Function Name	Description
13	OE3	Output 3 enable
12	OE3_override	If this bit is 0, output 3 is controlled by the OE3 pin. If this bit is 1, output 3 is controlled by bit 13.
11	OE2	Output 2 enable
10	OE2_override	If this bit is 0, output 2 is controlled by the OE2 pin. If this bit is 1, output 2 is controlled by bit 11.
9	OE1	Output 1 enable
8	OE1_override	If this bit is 0, output 1 is controlled by the OE1 pin. If this bit is 1, output 1 is controlled by bit 9.
7	Refsel2	Control of PLL2 reference selection multiplexer  Selection: 0 - The input for PLL2 is XO1/XO2. 1 - The input for PLL2 is XO3/XO4 or In_p/In_n in based on xtal2_enable in Register 0xA
6	Reserved	Leave as default (Set to 1)
5	Refsel1	Control of PLL1 reference selection multiplexer  Selection: 0 - The input for PLL1 is XO1/XO2. 1 - The input for PLL1 is XO3/XO4 or In_p/In_n in based on xtal2_enable in Register 0xA
4	Reserved	Leave as default (Set to 1)
3	PU2	Power up PLL2
2	Reserved	Leave as default (Set to 1)
1	PU1	Power up PLL1
0	Reserved	Leave as default (Set to 1)

Register_Address: <b>0x3</b> Register Name: <b>Device_config2</b> Default Value: 0x100F0000 Type: <b>R/W</b>		
Bit Field	Function Name	Description
31:30	Refmode[1:0]	Determine the mode of the reference output (RefOut_p/RefOut_n)  Selection: 0b11 -HCSL (differential) 0b10 -LVPECL (differential) 0b01 -LVDS (differential) 0b00 -LVCMOS (single ended) - <b>default</b>
29:28	Reserved	Leave as default (Set to 1)
27	refmux_sel	Reference Multiplexer:  Selection: 0 - Reference output from Crystal Input 1 (XO1/XO2) 1 - Reference output from In_p/In_n or Crystal Input 2 (XO3/XO4) based on xtal2_enable in Register 0xA
26	xtal_enable	Enables the XO1/XO2 crystal input 1 function
25	diff_ref_sel	Sets the mode for In_p/In_n  Selection: 0 - CMOS (singled ended) - Input signal on In_p Note: In_n should not be connected 1 - Differential - Input signal on In_p/In_n pair
24	Reserved	Leave as default
23:20	Ref_div[3:0]	Reference divider is (bits[23:20] + 1) Range: 1 (0x0) to 16 (0xF)
19	Reserved	Leave as default (Set to 1)
18	Reserved	Leave as default (Set to 1)
17	Reserved	Leave as default (Set to 1)
16	Reserved	Leave as default (Set to 1)
15:12	Reserved	Leave as default
11	out4_4p5 mode	When this bit is 1, an output divisor of 4.5 is selected for output 4
10	out3_4p5 mode	When this bit is 1, an output divisor of 4.5 is selected for output 3
9	out2_4p5 mode	When this bit is 1, an output divisor of 4.5 is selected for output 2
8	out1_4p5 mode	When this bit is 1, an output divisor of 4.5 is selected for output 1
7:0	Reserved	Leave as default

Register_Address: <b>0x4</b> Register Name: <b>Buffer_config</b> Default Value: <b>0x0000</b> Type: <b>R/W</b>		
Bit Field	Function Name	Description
15	xtal_ftrim	Set based on crystal frequency Set bit to 1 if crystal is below 33 MHz, otherwise set to 0.
14:12	xtal_cap[2:0]	The crystal I/O pins have an internal load capacitance according to the equation $(10 + 2 * \text{xtal\_cap})$ pF. The 3-bit value ranges from 0 to 7, so the minimum capacitive load is 10 pF, and the maximum is 24 pF.
11	Reserved	Leave as default
10:8	xtal_gain[2:0]	Sets the gain in the crystal input 1 (XO1/XO2) amplifier.  The application note has suggested values for this parameter based on the crystal's equivalent series resistance (ESR) and nominal frequency.
7:6	Out4mode[1:0]	Mode for output 4  Selection: 0b11 -HCSL (differential) 0b10 -LVPECL (differential) 0b01 -LVDS (differential) 0b00 -LVCMOS (single ended)
5:4	Out3mode[1:0]	Mode for output 3 - See description for bits 7:6
3:2	Out2mode[1:0]	Mode for output 2 - See description for bits 7:6
1:0	Out1mode[1:0]	Mode for output 1- See description for bits 7:6
