Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

ZL30722

3-Input, 3-Output IEEE 1588 and SyncE Packet Clock Network Synchronizer

Product Brief

January 2016

Features

- **Packet Network Frequency and Phase Sync**
  - Frequency accuracy for GSM, WCDMA-FDD, LTE-FDD basestations and small cells
  - Frequency performance for ITU-T G.823 and G.824 synchronization interface, G.8261 PNT PEC and CES interfaces and G.8263 PEC-S-F
  - Phase synchronization performance for WCDMA-TDD, TD-SCDMA, CDMA2000, LTE-TDD and LTE-A applications
  - Client holdover and reference switching between multiple servers
  - Support for new ITU-T packet clock drafts or recs: G.8263 PEC, G.8273.2 T-BC & T-TSC w/o SyncE, and G.8273.4 T-BC-P & T-TSC-P
  - Hybrid mode for mixing SyncE and IEEE1588
- **Physical Layer Clock Synchronization**
  - ITU-T G.8262 SyncE EEC option 1 & 2
- **Low-Bandwidth DPLL**
  - Programmable bandwidth, 0.1Hz to 500Hz
  - Hitless reference switching
  - High-resolution holdover averaging
  - Numerically controlled oscillator mode
- **Input Clocks**
  - Three inputs, two differential/CMOS, one CMOS
  - Any input frequency from 8kHz to 1250MHz (8kHz to 300MHz for CMOS)
  - Per-input activity and frequency monitoring

Ordering Information

ZL30722LDG1	32 Pin QFN	Trays
ZL30722LDF1	32 Pin QFN	Tape and Reel

Matte Tin

Package size: 5 x 5 mm

-40°C to +85°C

- **Low-Jitter Fractional-N APLL and 3 Outputs**
  - Any output frequency from <1Hz to 1035MHz
  - High-resolution fractional frequency conversion with 0ppm error
  - Encapsulated design requires no external VCXO or loop filter components
  - Output jitter as low as 0.25ps RMS (12kHz-20MHz integration band)
  - Outputs are CML or 2xCMOS, can interface to LVDS, LVPECL, HSTL, SSTL and HCSL
  - Per-output supply pin with CMOS output voltages from 1.5V to 3.3V
  - Precise output alignment circuitry and per-output phase adjustment
  - Per-output enable/disable and glitchless start/stop (stop high or low)
- **General Features**
  - Automatic self-configuration at power-up from internal EEPROM; up to four configurations
  - Input-to-output alignment with external feedback
  - SPI or I^2C processor Interface
  - Easy-to-use evaluation software

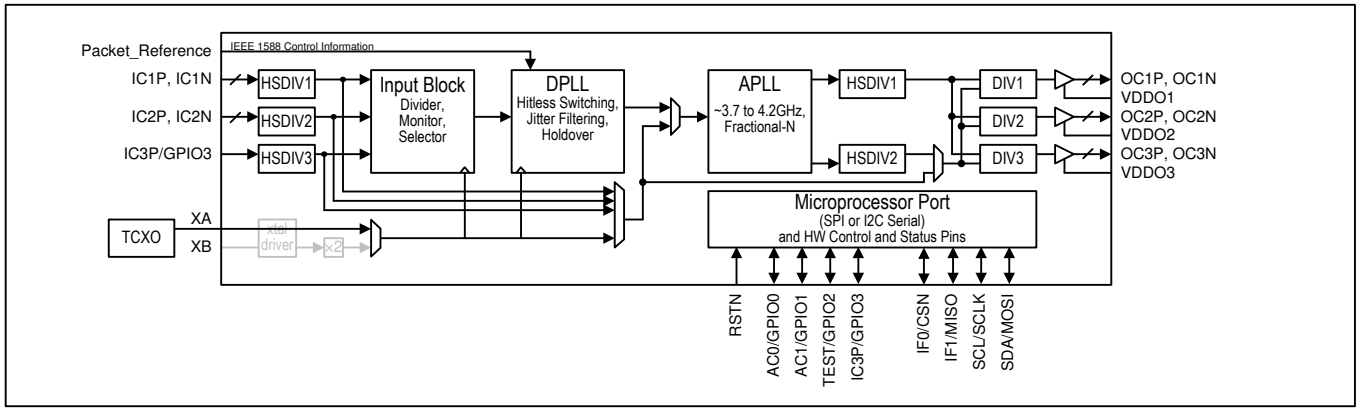

Figure 1 - Functional Block Diagram

1. Detailed Features

1.1 Time Synchronization Algorithm

- External algorithm controls software digital PLL to adjust frequency and phase alignment
- Frequency, phase and time synchronization over IP, MPLS and Ethernet packet networks
- Frequency accuracy performance for GSM, WCDMA-FDD, LTE-FDD femtocell, small cell (residential, urban, rural, enterprise), picocell and macrocell applications, with target performance less than ±15 ppb
- Frequency performance for ITU-T G.8263 for PEC-S-F (Packet Equipment Clock - Slave - Frequency)
- Frequency performance for ITU-T G.823 and G.824 synchronization interface, as well as G.8261 PNT EEC, PNT PEC and CES interface specifications
- Phase synchronization performance for WCDMA-TDD, Mobile WiMAX, TD-SCDMA, CDMA2000, LTE-TDD and LTE-A femtocell, small cell (residential, urban, rural, enterprise), picocell and macrocell applications with target performance less than ± 1µs phase alignment.
- hase performance for ITU-T packet clock drafts or recommendations in development
  - ITU-T G.8273.2 T-BC & T-TSC, when not using SyncE input
  - ITU-T G.8273.4 T-BC-P & T-TSC-P
- Supports hybrid mode for mixing SyncE and IEEE1588 inputs
- Time Synchronization for TAI, UTC-traceability and GNSS/GPS replacement.
- Client reference switching between multiple servers
- Client holdover when server packet connectivity is lost
- Client synchronization to best server with monitoring of secondary server references

1.2 Input Clock Features

- Three input clocks, two differential or single-ended, one single-ended
- Input clocks can be any frequency from 8kHz up to 1250MHz (differential) or 300MHz (single-ended)
- Supported telecom frequencies include PDH, SDH, Synchronous Ethernet, OTN, wireless
- Inputs constantly monitored by programmable activity monitors and frequency monitors
- Fast activity monitor can disqualify the selected reference after a few missing clock cycles
- Frequency measurement and monitoring with 1ppm resolution and accept/reject hysteresis
- Optional input clock invalidation on GPIO assertion to react to LOS signals from PHYs

1.3 Electrical Clock Engine Features

- Very high-resolution DPLL architecture
- State machine automatically transitions between tracking and freerun/holdover states
- Revertive or nonrevertive reference selection algorithm
- Programmable bandwidth from 0.1Hz to 500Hz
- Less than 0.1dB gain peaking
- Programmable phase-slope limiting
- Programmable tracking range (i.e. hold-in range)
- Truly hitless reference switching with <200ps output clock phase transient
  - Physical-clock-to-physical-clock reference switching
  - Physcial-clock-to-packet-timing reference switching
  - Packet-timing-to-physcial-clock reference switching
  - Packet-timing-to-packet-timing reference switching
- Support for SyncE and SONET/SDH equipment clock specifications
  - ITU-T G.8262 option 1 EEC
  - ITU-T G.8262 option 2
  - ITU-T G.813 option 1 SEC
  - IUT-T G.813 option 2
- Output phase adjustment in 10ps steps
- High-resolution frequency and phase measurement
- Fast detection of input clock failure and transition to holdover mode
- Holdover frequency averaging with programmable averaging time and delay time

1.4 APLL Features

- Very high-resolution fractional scaling (i.e. non-integer multiplication)
- Any-to-any frequency conversion with 0ppm error
- Two high-speed dividers (integers 4 to 15, half divides 4.5 to 7.5)
- Easy-to-configure, completely encapsulated design requires no external VCXO or loop filter components
- Bypass mode supports system testing

1.5 Output Clock Features

- Three low-jitter output clocks
- Each output can be one differential output or two CMOS outputs
- Output clocks can be any frequency from 1Hz to 1035MHz (250MHz max for CMOS and HSTL outputs)
- Output jitter as low as 0.25ps RMS (12kHz to 20MHz)
- In CMOS mode, an additional divider allows the OCxN pin to be an integer divisor of the OCxP pin (Example 1: OC3P 125MHz, OC3N 25MHz. Example 2: OC2P 25MHz, OC2N 1Hz)
- Outputs easily interface with CML, LVDS, LVPECL, HSTL, SSTL, HCSL and CMOS components
- Supported telecom frequencies include PDH, SDH, Synchronous Ethernet, OTN
- Sophisticated output-to-output phase alignment
- Per-output phase adjustment with high resolution and unlimited range
- Per-output enable/disable
- Per-output glitchless start/stop (stop high or low)

1.6 General Features

- SPI or I^2C serial microprocessor interface
- Automatic self-configuration at power-up from internal EEPROM memory; pin control to specify one of four stored configurations
- Numerically controlled oscillator (NCO) behavior allows system software to steer DPLL frequency with resolution better than 0.01ppb
- Input-to-output alignment with external feedback
- Four general-purpose I/O pins each with many possible status and control options
- Output frame sync signals: 2kHz or 8kHz (SONET/SDH), 1Hz (IEEE 1588) or other frequency
- Internal compensation for local oscillator frequency error

1.7 API Software

- Interfaces to 1588-capable PHYs and switches with integrated timestamping
- Abstraction layer for independence from OS and CPU, from embedded SoC to home-grown
- Fits into centralized, highly integrated “pizza box” architectures as well as distributed architectures with multiple line cards and timing cards

2. Applications

- ITU-T G.8262 system timing cards for Synchronous Ethernet systems
- System timing cards which support ITU-T G.781 SETS (SDH Equipment Timing Source)
- Integrated basestation reference synchronization for air interfaces for
  - GSM, WCDMA, TD-SCDMA, LTE and LTE-A
  - FDD or TDD mobile technology
  - Femtocells, small cells (residential, urban, rural, enterprise), picocells and macrocells
- Mobile Backhaul NID, cell-site router, edge switch/router, microwave or access aggregation node
- EPON/GPON OLT and ONU/ONT
- DSLAM and RT-DSLAM
- 10G, 40G and 100G line cards
- SONET/SDH, Fibre Channel, XAUI

3. Pin Diagram

The device is packaged in a 5x5mm 32-pin QFN.

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,400 employees globally. Learn more at **www.microsemi.com**.
